

Contents

1. TOWARDS AN ELECTRICALLY CONDUCTIVE CERAMIC	1
1.1 Introduction	1
1.2 The Path to a New Material	2
1.3 Initial Production of Test Material	5
2. THE PROPERTIES OF TITANIUM SUBOXIDE & ASSOCIATED PROCESSES	9
2.1 The Titanium – Oxygen Equilibrium Diagram	9
2.2 How to Produce Ti_4O_7 ?	13
2.2.1 General Considerations	13
2.2.2 Porosity in Hydrogen-Reduced Titania Ceramic	26
2.3 Plating/Coating of Ti_4O_7 with Metals and/or Metal Oxides	31
2.4 The Electrical Resistance of the Suboxide	33
2.5 Corrosion Resistance and Electrochemical Properties	36
2.6 Electrical Connection to Monolithic Ti_4O_7	44
2.7 Handling/Machining	46
3. APPLICATIONS – I	49
3.1 Zinc Electrowinning	49
3.2 Swimming Pool Electrochlorinators	51
3.3 Cathodic Protection	58
3.3.1 Cathodic Protection of Rebars in Concrete	59

4. APPLICATIONS – II	67
4.1 Electrode Boiling	67
4.2 Electro Osmotic Damp Proofing	69
4.3 Chlorine and Chlorate Electrolysis	70
4.4 Hydrochloric Acid Electrolysis	72
4.5 Electrolytic Sterilisation of Water	72
4.6 Other Electrochemical Applications for Monolithic Ti_4O_7	74
4.7 Monolithic Ti_4O_7 in Lightweight Batteries	74
5. IS Ti_4O_7 AN OPTIMUM CERAMIC ELECTRODE CHOICE?	77
5.1 Some General Reflections	77
5.2 Costs and Prices	80
6. CONCLUSIONS AND EPILOGUE	81
6.1 Successes and Failures	81
6.2 Epilogue – A Gathering of Many Strands	81
Acknowledgements	83
REFERENCES AND FURTHER READING	85
INDEX	95
