

Acknowledgements

Without Dr Rosaria Ciriminna's exceptional chemical talent, none of what we have achieved at Palermo's CNR would have been possible. I thank her for all the creative joint work, and for a unique style, that enabled the introduction of several new sol-gel functional silicas for a multiplicity of applications (and much else).

Starting in late 1996, the University of Jerusalem's Professor David Avnir, the pioneer of sol-gel doped materials, has been much more than a mentor. I thank him also for all he has done for me in all these years. The wonderful work of Sharon Marx with chiral sol-gels is impressive, and also, Sharon, the celebration of Hanukkah at your parents' home in Jerusalem in late 2001 will not be forgotten.

I am indebted to Professor Daniel Mandler, also from the University of Jerusalem, for his memorable talk on science in Israel, given at our institute in May 2007.

PhD student Giovanni Palmisano joined us in 2005 and is now completing a remarkable doctorate in chemical engineering at Palermo University. His talent, commitment and constancy of purpose will form the basis of a similarly great career in science.

Montpellier's ENSC director Joël Moreau and senior researcher Michel Wong Chi Man have taught us plenty of advanced materials chemistry. We thank them for a splendid collaboration and for their warm hospitality.

Working with the University of Padua's Professor Sandro Campes-trini and Dr Massimo Carraro has been (and is) as fruitful as it is pleasant. And similarly joyful is the research with Professor Laura M. Ilharco and Dr Alexandra Fidalgo at Lisboa Polytechnic. We thank the University of Poitiers' Professor Eric Le Bourhis and Madrid's CSIC senior researcher Marisa Ferrer for rewarding shared work on sol-gel thin films and on photochemical and biomaterials, respectively.

Cooperation on the use of sol–gel marine antifouling with Professor Sebastiano Tusa and Dr Pietro Selvaggio, of Sicily’s Superintendence of the Sea, is gratefully acknowledged along with that of Professors Michael Detty and Frank V. Bright of the University of New York at Buffalo.

The R&D director of SiliCyle, Dr Francois Béland, has been pivotal in guiding the development of the SiliaCat series of sol–gel entrapped catalysts. And I would like to recall here also his and Hugo St-Laurent’s visit to Palermo in October 2007.

I wish to express my appreciation to the academic colleagues who have exchanged information relevant to the book. They are the leading researchers in many of the fields discussed therein and this work owes much of its relevance to their scientific effort. I thereby acknowledge the assistance of Dr Christophe Barbé (Ceramisphere), John Berg (University of Washington), Boris Mahltiz (Gmbu, Jena), and Paul Ducheyne (University of Pennsylvania).

Finally, I am grateful to Dr Arjan E. J. de Nooy (now at Rijswijk office of EPO) for all he has taught me about chemistry and scientific writing; but also, and above all, about love for life and friendship.

RSC Publishing’s Katrina Harding and Merlin Fox were instrumental in producing this book.
