<b>Chapter 1</b>	<b>Solid Electrolyte Electrochemical Cells for Catalyst Sensing</b>	<b>1</b>
	<i>By Ian S. Metcalfe</i>	
1	Introduction	1
2	Electrochemical Principles	4
2.1	Open-circuit Behaviour	4
2.1.1	Single Charge-transfer Process	4
2.1.2	Mixed Potentials	6
2.2	Closed-circuit Behaviour	6
2.3	Charge-transfer Mechanism	10
2.3.1	Metal Electrodes	11
2.3.2	Oxide Electrodes	12
3	Potentiometric Studies	13
3.1	Metal Catalysts	14
3.1.1	Total Oxidation	14
3.1.1.1	Sulfur dioxide oxidation	14
3.1.1.2	Hydrogen oxidation	15
3.1.1.3	Carbon monoxide oxidation	16
3.1.1.4	Methane oxidation	20
3.1.1.5	Ethylene and ethylene oxide oxidation	21
3.1.2	Partial Oxidation	22
3.1.2.1	Oxidative coupling of methane	22
3.1.2.2	Ethylene epoxidation	22
3.1.2.3	Propene epoxidation	23
3.1.3	Other Reactions	23
3.1.3.1	Nitric oxide reduction with carbon monoxide	23
3.1.3.2	Nitric oxide reduction with ammonia	23
3.2	Oxide Catalysts	24
3.2.1	Total Oxidation	25
3.2.1.1	Hydrogen oxidation	25
3.2.1.2	Carbon monoxide oxidation	26
3.2.2	Partial Oxidation	28
3.2.2.1	Propene to acrolein	28
3.2.2.2	Maleic anhydride production	28
3.2.2.3	Synthesis gas production	28

4	Amperometric Studies	29
4.1	Steady-state Current Overpotential Behaviour	29
4.2	Cyclic Voltammetry	29
4.3	Other Techniques	32
5	Summary and Future Opportunities	32
	Nomenclature	33
	<i>References</i>	34
<b>Chapter 2</b>	<b>Molecular Engineering of Supported Metal Oxide Catalysts: Oxidation Reactions over Supported Vanadia Catalysts</b>	<b>37</b>
	<i>By Israel E. Wachs</i>	
1	Introduction	37
2	Molecular Characterization	39
3	Which Metal Oxide Bonds Are Critical for Oxidation Reactions: V=O, V-O-V or V-O-Support?	39
3.1	Bridging V-O-V Bonds	39
3.2	Terminal V=O Bonds	40
3.3	Bridging V-O-Support Bonds	41
4	Methanol Oxidation Reaction Kinetics and Influence of the Oxide Support	42
5	Influence of the Oxide Support upon Different Oxidation Reactions	45
6	Number of Surface Sites Required for Oxidation Reactions	46
7	Influence of Surface Metal Oxide Additives upon Oxidation Reactions	47
7.1	Promoters	47
7.2	Poisons	48
8	Influence of the Specific Oxide Support Phase	49
9	Influence of Preparation Method	50

10	Conclusions	51
	Acknowledgments	52
	References	52
<b>Chapter 3</b>	<b>Zeolite-catalysed Alkylation of Polynuclear Aromatics</b>	<b>55</b>
	<i>By Yoshihiro Sugi and Yoshihiro Kubota</i>	
1	Introduction	55
2	Mechanisms of Shape-selective Catalysis	56
3	Alkylation of Biphenyl	57
3.1	Isopropylation	57
3.1.1	Catalysis over Typical Zeolites	57
3.1.2	Isopropylation over H-Mordenite	58
3.1.3	Effect of the Dealumination of H-Mordenite	58
3.1.4	Effect of Propylene Pressure on Selectivity	63
3.1.5	Effects of the Modification of H-Mordenite	65
3.2	Isopropylation over HY, HL and Other Zeolites	65
3.3	Alkylation with Other Alkenes over H-Mordenite	66
3.4	Isopropylation and Ethylation of 4-Alkylbiphenyls over H-Mordenite	67
4	Alkylation of Naphthalene	67
4.1	Methylation of Naphthalene over Zeolites	67
4.2	Isopropylation of Naphthalene	69
4.2.1	Catalysis over Typical Zeolites	69
4.2.2	Effect of the Dealumination of H-Mordenite	70
4.2.3	Deactivation of External Acid Site of H-Mordenite	75
4.2.4	Isopropylation over HY, HL and Other Zeolites	77
4.2.5	Alkylation with Other Alkenes	78
5	Alkylation of Other Polynuclear Hydrocarbons	79
6	Transalkylation of Biphenyl and Naphthalene	80
7	Conclusion	80
	Acknowledgments	81
	References	81

<b>Chapter 4</b>	<b>Preparation and Characterization of Hexaaluminate Materials for High-temperature Catalytic Combustion</b>	<b>85</b>
	<i>By G. Groppi, C. Cristiani and P. Forzatti</i>	
1	Introduction	85
2	Preparation Methods of Hexaaluminate Materials	86
	2.1 Solid State Reaction	86
	2.2 Hydrolysis of Alkoxides	88
	2.3 Other Sol-gel Processes	90
	2.4 Co-precipitation in Aqueous Medium	90
3	Thermal Evolution of the Precursor and Formation Mechanism of the Hexaaluminate Phases	92
	3.1 Solid State Reaction	92
	3.2 Hydrolysis of Alkoxides	93
	3.3 Co-precipitation in Aqueous Medium	94
	3.4 Effect of the Transition Metal Ions	95
4	Characterization of Hexaaluminate Properties Relevant to Catalytic Combustion	97
	4.1 Structural Properties and Sintering Behavior	98
	4.2 Catalytic Combustion Properties of M-substituted Hexaaluminates	102
	4.3 Nature and Role of the Transition Metal Ion in the Structure	105
5	Use of Hexaaluminates in Catalytic Combustor for Gas Turbines	107
6	Conclusions	111
	<i>References</i>	111
<b>Chapter 5</b>	<b>Catalytic Conversions in Water. An Environmentally Benign Concept for Heterogenization of Homogeneous Catalysis</b>	<b>114</b>
	<i>By Georgios Papadogianakis and Roger A. Sheldon</i>	
1	Introduction	114
2	Water Soluble Ligands	116
3	Olefin Hydroformylation	137
	3.1 Hydroformylation of Propene: the Ruhrchemie/Rhône-Poulenc (RCH/RP) Process	140

3.2	Hydroformylation of Other Lower Olefins and Dienes	141
3.3	Hydroformylation of Mid Range Olefins	142
3.4	Hydroformylation of Higher Olefins	144
3.4.1	Catalysis in Micellar Microheterogeneous Systems	144
3.4.2	Thermoregulated Phase Transfer Catalysis	147
3.4.3	Monophasic Reaction with Biphasic Catalyst Separation and Recycling	148
3.5	Hydroformylation of Functionalised Olefins	149
4	Olefin Hydrocarboxylation	152
5	Carbonylation	154
5.1	Carbonylation of Alcohols	154
5.2	Carbonylation of Halides	159
6	Hydrogenation	161
6.1	Hydrogenation of Carbonyl Compounds	161
6.2	Hydrogenation of Olefins	163
6.2.1	Hydrogenation of Simple Olefins	163
6.2.2	Hydrogenation of Allyl Alcohol	164
6.2.3	Enantioselective Hydrogenation of Prochiral Olefins	164
6.3	Hydrogenation of CO <sub>2</sub>	165
7	Alkylation	165
7.1	Addition of Active C-H compounds to Dienes: the Rhône-Poulenc Process for Geranylacetone	165
7.2	Heck-, Suzuki- and Stille-type Couplings	166
8	Telomerization of 1,3-Butadiene: the Kuraray Process	168
9	Miscellaneous Reactions	171
10	Counter (Inverse) Phase Transfer Catalysis	174
11	Supported Aqueous Phase (SAP) Catalysis	175
12	Concluding Remarks / Future Prospects	176
	<i>References</i>	177
