Chapter 1	Catalytic Oxidation of Methane on Supported Palladium Under Lean Conditions: Kinetics, Structure and Properties	1
	<i>By Ya-Huei Chin and Daniel E. Resasco</i>	
1	Introduction	1
2	Catalytic Combustion of Methane at Low Temperatures (below 800 °C)	3
2.1	Effects of Particle Size	3
2.2	Time-dependent Catalytic Activity	5
2.3	Effects of Thermal Pretreatments	6
3	Structure of Pd Species and its Effects on Catalytic Activity	8
3.1	Sintering and Redispersion of Pd Species under Different Environments	8
3.2	Interaction of Pd with Oxygen and its Effects on Activity	10
3.3	Characterization of the Pd–O Bond Strength	14
3.4	Stability of Pd Species on Different Supports	16
4	Reaction Kinetics and Possible Mechanisms	18
4.1	Mass and Heat Transfer Limitations	18
4.2	Kinetics and Mechanisms	19
5	Catalytic Combustion of Methane at High Temperatures (above 800 °C)	22
5.1	Hysteresis in Activity and Oxygen Content	22
5.2	Catalyst Improvement for High Temperature Operation	25
6	Rate Inhibition by Impurities and Products	26
6.1	Inhibition by H ₂ S and SO ₂	26
6.2	Inhibition by Water and CO ₂	28

7	Methane Combustion in the Presence of NO on Low-loading Pd/Zeolite Catalysts	29
7.1	Suppression of Combustion Activity	29
7.2	Characterization of Pd Species Stabilized by the Support in the Presence of NO	31
8	Concluding Remarks	34
	Acknowledgement	35
	<i>References</i>	35
Chapter 2	Innovations in Catalytic Inorganic Membrane Reactors	40
	<i>By Anthony G. Dixon</i>	
1	Introduction	40
2	Background on Catalytic Inorganic Membrane Reactors	41
2.1	Types of Membrane and Reactor Configurations	42
2.2	Membrane Reactors for Preferential Removal of a Species	45
2.2.1	Principles	45
2.2.2	Applications	47
2.3	Membrane Reactors for Distributed Addition of a Reactant	47
2.3.1	Principles	48
2.3.2	Applications	50
2.4	Membrane Reactors for Control of Reactant Contact	51
2.4.1	Multiphase Membrane Reactor	51
2.4.2	Non-permeable CMR	51
3	Challenges for Catalytic Inorganic Membrane Reactors	52
3.1	Technical and Materials Challenges	53
3.2	Competitiveness Challenges	55
3.2.1	Product Removal	56
3.2.2	Reactant Feed	58
3.3	Challenges Lead to Innovations	59
4	Innovations in Catalytic Inorganic Membrane Reactors	60
4.1	Thermal Effects in Membrane Reactors	60
4.1.1	Temperature Control by Reactant Feed	61
4.1.2	Reaction Control by Thermal and Reactant Fluxes	64
4.1.3	Thermal Coupling	64
4.2	Synergy between Reaction and Permeation	66
4.2.1	Use of the Reaction to Improve Driving Force	66

4.2.2	Use of the Reaction to Modify the Membrane and Improve Driving Force	67
4.3	Control of Contact between Catalyst and Reactants	73
4.3.1	Control of Contact Mode	73
4.3.2	Control of Catalyst Location in a CMR	75
4.3.3	Control of Reactant Concentration at the Catalyst	77
4.4	Zeolite Membrane Reactors	78
4.5	Integration of Functionality through Multiple Membranes	81
4.5.1	Two Separate Membranes	81
4.5.2	Multiple Layer Membranes	83
5	Summary of Recent Developments	84
6	Concluding Remarks	86
	Acknowledgements	86
	References	87
Chapter 3	Kinetic Coupling in and between Catalytic Cycles	93
	<i>By Michel Boudart</i>	
1	Introduction	93
2	The Chain or Catalytic Cycles	93
3	The De Donder Reaction: A Thermodynamic Measure of the Kinetic Irreversibility of an Elementary Step	94
4	The Bodenstein Kinetic Steady State	94
5	Depletion of the Product of a Thermodynamically Unfavorable Step by a Following Step	95
6	Accumulation of the Reactant in a Thermodynamically Unfavorable Step through a Preceding Step	96
7	Kinetic Coupling between Chain Cycles	99
7.1	A Case for Negative Catalysis	99
7.2	Changes in Selectivity through Kinetic Coupling between Chain Cycles	101
7.3	Changes in Selectivity through Kinetic Coupling between Cycles in Homogeneous Catalysis	102

7.4	Control of Selectivity through Kinetic Coupling between Heterogeneous Catalytic Cycles	103
7.5	Kinetic Coupling between Multiple Catalytic Cycles: Cracking of Alkanes on Zeolites	106
8	Summary and Conclusions	107
	<i>References</i>	108
Chapter 4	Catalytic Resource Recovery from Waste Polymers	110
	<i>By Linda J. Broadbelt</i>	
1	Introduction	110
2	Thermal Degradation	112
2.1	Polyethylene	113
2.2	Polypropylene	113
2.3	Polystyrene	113
3	Catalyst–Polymer Contacting Patterns	118
3.1	Thermal Degradation Followed by Catalytic Decomposition	119
3.2	Co-milling of Polymer and Catalyst	121
3.2.1	Semibatch Mode	121
3.2.2	Batch Mode	122
3.3	Flow Systems	123
4	Acid-catalysed Degradation	123
4.1	Product Distributions	124
4.1.1	Silica–Alumina	124
4.1.2	Zeolites	129
4.1.3	Other Materials	132
4.2	Mechanistic Interpretation	134
4.2.1	Polyethylene and Polypropylene	134
4.2.2	Polystyrene	135
5	Base-catalysed Degradation	136
5.1	Product Distributions	136
5.1.1	Polyethylene and Polypropylene	136
5.1.2	Polystyrene	137
5.2	Mechanistic Interpretation	137
6	Co-processing with Other Feedstocks	138
6.1	Hydrocarbon Solvents	138
6.2	Coal	139

7	Summary	141
	<i>References</i>	143
Chapter 5	Can Heterogeneous Catalysts Contribute to Clean Synthesis of Fine Chemicals – on the Example of Fragrances	148
	<i>By Wolfgang F. Hölderich and D. Heinz</i>	
1	Introduction	148
2	Isomerization of Epoxides	149
2.1	Isomerization of Styrene Oxides	149
2.2	Isomerization of α -Pinene Oxide	151
2.3	Isomerization of Isophorone Oxide	153
2.4	Isomerization of 1,5-Dioxaspiro[2.5]octane	157
2.5	Isomerization of 4,4,5,8-Tetramethyl-1-oxa-spiro[2.5]octane	157
3	Alkoxylation and Mercaptanization of Limonene and α -Pinene	161
3.1	Alkoxylation of Limonene	163
3.1.1	Reactions in the Batch Reactor	163
3.1.2	Reaction in an Integral Continuous Flow Fixed Bed Reactor	165
3.2	Alkoxylation of α -Pinene	166
3.2.1	Reactions in the Batch Reactor	166
3.3	Sulfur-containing Fragrances and Flavours	167
4	Esterification of Dicyclopentadiene with Carboxylic Acids	168
4.1	Esterification of Dicyclopentadiene with Saturated Acids	169
4.2	Esterification of Terpenes	171
5	Heterogeneous Catalysed Synthesis of <i>p</i> -Cymene	171
5.1	Dehydrogenation of α -Limonene	172
5.1.1	Conversion over Unmodified H-ZSM-5 and H-US-Y	172
5.1.2	Conversion over Pd-modified H-ZSM-5	172
5.1.3	Conversion over Pd/Ce-modified H-ZSM-5	173
5.1.4	Conversion over Pd/Ce-modified Na-ZSM-5	174
5.1.5	Influence of Hydrogen as Carrier Gas	175
5.2	Dehydrogenation of Terpene Mixtures	175
5.2.1	Conversion over Zeolitic Catalysts	175
5.2.2	Silica Support	178
6	Conclusion	179

	<i>References</i>	180
Chapter 6	Catalytic Combustion for Gas Turbine Applications	183
	<i>By E. Magnus Johansson, Dennis Papadias, Philippe O. Thevenin, Anders G. Ersson, Rolf Gabrielsson, P. Govind Menon, Pehr H. Björnbom and Sven G. Järås</i>	
1	Introduction	183
1.1	Principles of the Catalytic Combustor	184
2	Formation and Abatement of Emissions	185
2.1	Low-NO _x Technologies for Gas Turbine Applications	185
2.2	Legislation for, and Expected NO _x Emissions from Gas Turbines	186
3	High Temperature Materials	187
3.1	The Support	187
3.1.1	Alumina (Al ₂ O ₃)	190
3.1.2	Cordierite (2MgO·2Al ₂ O ₃ ·5SiO ₂)	190
3.1.3	Mullite (3Al ₂ O ₃ ·2SiO ₂)	191
3.1.4	Magnesia (MgO)	191
3.1.5	Zirconia (ZrO ₂) and Hafnia (HfO ₂)	191
3.1.6	Silicon Carbide (SiC)	191
3.1.7	NZP (Na ₂ O–Zr ₂ O–P ₂ O ₅ –SiO ₂)	192
3.1.8	FeCr Alloy	192
3.2	Washcoat and Active Material	193
3.2.1	Hexa-aluminates	193
3.2.2	Perovskites	195
3.2.3	Spinel	195
3.2.4	Pyrochlores	196
3.2.5	Zeolites	196
3.2.6	Future Promising Materials	196
3.2.7	The Platinum Group Metals	196
3.2.8	Single-metal Oxides	198
4	Mathematical Modelling in Catalytic Combustion	199
4.1	One-dimensional Models	200
4.2	Comparison of Lumped and Distributed Models at Laminar Flows	201
4.2.1	Heat and Mass Transfer Coefficients	201
4.2.2	Multiple Steady States	206
4.3	Distributed Models	206
4.4	Modelling the Washcoat	207
4.5	Modelling Interactions between Channels	208
5	Gas Turbine Applications	209
5.1	Fundamental Gas Turbine Considerations	209

5.2	Recent Pilot- and Full-scale Demonstrations of Catalytic Combustors	210
5.2.1	Fully Catalytic Design Ia: Mid- and Large-size Gas Turbines Running on LNG	210
5.2.2	Fully Catalytic Design Ib: Small-size Recuperative Gas Turbines	214
5.2.3	Hybrid Design IIa: Partially Inactive Catalyst	215
5.2.4	Hybrid Design IIb: Secondary Fuel	216
5.2.5	Hybrid Design IIc: Secondary Air	217
5.3	Case Study: The European AGATA Project	217
5.3.1	Technical Specification	218
5.3.2	Catalytic Combustor	219
5.4	Use of Different Fuels and Their Characteristics	221
5.5	Recent Patents	222
6	Deactivation of Combustion Catalysts	222
6.1	Sintering and Vaporization	226
6.2	Thermal Stresses and Fracture of the Catalyst	226
6.3	Poisoning	226
7	Spin-off Benefits for Other Areas in Combustion	227
7.1	Eco-friendly Coke Combustion in FCC	228
8	Summary	229
	Acknowledgements	230

Chapter 7	The Oligomerization of Alkenes by Heterogeneous Catalysts	236
	<i>By Mehri Sanati, Christina Hörnell and Sven G. Järås</i>	
1	Introduction	236
2	Principles of Oligomerization Reactions	237
3	Mechanistic Investigation and Kinetics of Alkene Oligomerization	239
4	Ethylene Oligomerization	241
4.1	Zeolites	242
4.2	Other Solid-acid Catalysts	243
5	Propene Oligomerization	248
5.1	Zeolites	248
5.2	Other Solid-acid Catalysts	250

6	Butene Oligomerization	260
6.1	Zeolites	260
6.2	Other Solid-acid Catalysts	261
7	Long-chain Alkene Oligomerization	266
7.1	Zeolites	267
7.2	Other Solid-acid Catalysts	274
8	Dimerization of Alkenes	275
9	Conclusions	279
