Computer-Aided Drug Design 2003–2005	1
<i>By Bernard Coupez, Henrik Möbitz and Richard A. Lewis</i>	
1 Introduction	1
2 ADME/Tox and Druggability	1
2.1 Druggability and Bioavailability	1
2.2 Metabolism, Inhibitors and Substrates	2
2.3 Toxicity	4
3 Docking and Scoring	4
3.1 Ligand Database Preparation	4
3.2 Target Preparation	5
3.3 Water Molecules	6
3.4 Comparison of Docking Methods	6
3.5 Scoring	7
3.6 New Methods	8
3.7 Application of Virtual Screening	9
4 <i>De Novo</i> , Inverse QSAR and Automated Iterative Design	10

5	3D-QSAR	11
6	Pharmacophores	11
7	Library Design	12
8	Cheminformatics and Data Mining	13
	8.1 Scaffold Hopping	13
	8.2 Descriptors and Atom Typing	14
	8.3 Tools	15
9	Structure-Based Drug Design	15
	9.1 Analysis of Active Sites and Target Tracability	15
	9.2 Kinase Modelling	16
	9.3 GPCR Modelling	16
10	Conclusions	18
	References	18

Modelling Biological Systems 23

By Adrian J. Mulholland

1	Introduction	23
2	Empirical Forcefields for Biomolecular Simulation: Molecular Mechanics (MM) Methods	24
3	Combined Quantum Mechanics/Molecular Mechanics (QM/MM) Methods	29
	3.1 Interactions between the QM and MM Regions	31
	3.2 Basic Theory of QM/MM Methods	34
	3.3 Treatment of Long-Range Electrostatic Interactions in QM/MM Simulations	35
	3.4 QM/MM Partitioning Methods and Schemes	37
4	Some Comments on Experimental Approaches to the Determination of Biomolecular Structure	41
5	Computational Enzymology	43
	5.1 Goals in Modelling Enzyme Reactions	43
	5.2 Methods for Modelling Enzyme-Catalysed Reaction Mechanisms	45
	5.3 Quantum Chemical Approaches to Modelling Enzyme Reactions: Cluster (or Supermolecule) Approaches, and Linear-Scaling QM Methods	45
	5.4 Empirical Valence Bond Methods	47
	5.5 Examples of Recent Modelling Studies of Enzymic Reactions	48
6	<i>Ab initio</i> (Car-Parrinello) Molecular Dynamics Simulations	59

7	Conclusions	60
	Acknowledgements	60
	References	61

**Polarizabilities, Hyperpolarizabilities and Analogous
Magnetic Properties** 69

By David Pugh

1	Introduction	69
2	Electric Field Related Effects	70
2.1	Atoms	70
2.2	Diatomic Molecules: Non-Relativistic	73
2.3	Diatomic Molecules: Relativistic	73
2.4	Atom-Atom Interactions	74
2.5	Inert Gas Compounds	74
2.6	Water	76
2.7	Small Polyatomic Molecules	87
2.8	Medium Sized Organic Molecules	88
2.9	Organo-Metallic Complexes	93
2.10	Open Shells and Ionic Structures	93
2.11	Clusters, Intermolecular and Solvent Effects, Fullerenes, Nanotubes	95
2.12	One and Two Photon Absorption, Luminescence <i>etc.</i>	95
2.13	Theoretical Developments	95
2.14	Oligomers and Polymers	96
2.15	Molecules in Crystals	96
3	Magnetic Effects	97
3.1	Inert Gases, Atoms, Diatomics	97
3.2	Molecular Magnetisabilities, Nuclear Shielding and Aromaticity, Gauge Invariance	98
	References	99

Applications of Density Functional Theory to Heterogeneous Catalysis 108

By David S. Scholl

1	Introduction	108
2	Success Stories	111
2.1	Success Story Number One: CO Oxidation over RuO ₂ (110)	111

2.2	Success Story Number Two: Ammonia Synthesis on Ru Catalysts	114
2.3	Success Story Number Three: Ethylene Epoxidation	122
3	Areas of Recent Activity	129
3.1	<i>Ab initio</i> Thermodynamics	130
3.2	Catalytic Activity of Supported Gold Nanoclusters	134
3.3	Bimetallic Catalysts	142
4	Areas Poised for Future Progress	146
4.1	Catalysis In Reversible Hydrogen Storage	146
4.2	Electrocatalysis	147
4.3	Zeolite Catalysis	148
5	Conclusion and Outlook	152
	Acknowledgements	152
	References	153

Numerical Methods in Chemistry 161

By *T.E. Simos*

1	Introduction	161
2	Partitioned Trigonometrically-Fitted Multistep Methods	163
2.1	First Method of the Partitioned Multistep Method	163
2.2	Second Method of the Partitioned Multistep Method	167
2.3	Numerical Results	172
3	Dispersion and Dissipation Properties for Explicit Runge-Kutta Methods	176
3.1	Basic Theory	176
3.2	Construction of Runge-Kutta Methods which is Based on Dispersion and Dissipation Properties	177
3.3	Numerical Results	181
4	Four-Step P-Stable Methods with Minimal Phase-Lag	185
4.1	Phase-Lag Analysis of General Symmetric $2k - \text{Step}, k \in \mathbb{N}$ Methods	185
4.2	Development of the New Method	186
4.3	Numerical Results	189
5	Trigonometrically Fitted Fifth-Order Runge-Kutta Methods for the Numerical Solution of the Schrödinger Equation	190
5.1	Explicit Runge-Kutta Methods for the Schrödinger Equation	190
5.2	Exponentially Fitted Runge-Kutta Methods	191

5.3 Construction of Trigonometrically-Fitted Runge-Kutta Methods	191
6 Four-Step P-Stable Trigonometrically-Fitted Methods	194
6.1 Development of the New Method	194
6.2 Numerical Results	198
7 Comments on the Recent Bibliography	200
References	209
Appendix A Partitioned Multistep Methods – Maple Program of Construction of the Methods	211
Appendix B Maple Program for the development of Dispersive-fitted and dissipative-fitted explicit Runge-Kutta method	216
Appendix C Maple Program for the development of explicit Runge-Kutta method with minimal Dispersion	223
Appendix D Maple Program for the development of explicit Runge-Kutta method with minimal Dissipation	230
Appendix E Maple Program for the development of the New Four-Step P-stable method with minimal Phase-Lag	237
Appendix F Maple Program for the development of the Trigonometrically Fitted Fifth-Order Runge-Kutta Methods	238
Appendix G Maple Program for the development of the New Four-Step P-stable Trigonometrically-Fitted method	244

Determination of Structure in Electronic Structure Calculations	249
<i>By Michael Springborg</i>	
1 Introduction	249
2 Determining the Global Total-Energy Minima for Clusters	256
2.1 Random vs. Selected Structures	256
2.2 Molecular-Dynamics and Monte Carlo Simulations	258
2.3 The Car-Parrinello Method	260

2.4	Eigenmode Methods	261
2.5	GDIIS	263
2.6	Lattice Growth	264
2.7	Cluster Growth	265
2.8	Aufbau/Abbau Method	265
2.9	The Basin Hopping Method	266
2.10	Genetic Algorithms	267
2.11	Tabu Search	268
2.12	Combining the Methods	270
3	Descriptors for Cluster Properties	271
3.1	Energetics	271
3.2	Shape	272
3.3	Atomic Positions	272
3.4	Structural Similarity	273
3.5	Structural Motifs	274
3.6	Phase Transitions	276
4	Examples for Optimizing the Structures of Clusters	278
4.1	One-Component Lennard-Jones Clusters	278
4.2	Two-Component Lennard-Jones Clusters	282
4.3	Morse Clusters	283
4.4	Sodium Clusters	284
4.5	Other Metal Clusters	288
4.6	Non-Metal Clusters	297
4.7	Metal Clusters with More Types of Atoms	299
4.8	Non-Metal Clusters with More Types of Atoms	304
4.9	Clusters on Surfaces	307
5	Determining Saddle Points and Reaction Paths	308
5.1	Interpolation	309
5.2	Eigenmode Methods	309
5.3	The Intrinsic Reaction Path	310
5.4	Changing the Fitness Function	310
5.5	Chain-of-States Methods	311
5.6	Nudged Elastic-Band Methods	312
5.7	String Methods	312
5.8	Approximating the Total-Energy Surface	314
6	Examples for Saddle-Point and Reaction-Path Calculations	314
7	Conclusions	318

Simulation of Liquids	324
<i>By B.D. Todd and D.J. Searles</i>	
1 Introduction	324
2 Classical Simulation Techniques	325
2.1 Statistical Mechanical Ensembles and Equilibrium Techniques	325
2.2 Nonequilibrium MD Simulations and Hybrid Atomistic-Continuum Schemes	328
3 Potential Energy Hypersurfaces for Liquid State Simulations	332
3.1 Quantum Mechanical Interaction Potentials for Weak Interactions	334
3.2 Three-Body Interactions	336
3.3 Potential Energy Functions for Confined Fluids	337
4 Quantum Mechanical Considerations	339
4.1 Born-Oppenheimer, Car-Parrinello and Atom-Centred Density Matrix Propagation Methods	339
4.2 Hybrid Methods	340
4.3 Cluster Calculations	341
4.4 Dynamical Quantum Effects	341
5 Lyapunov Exponents	343
6 Thermodynamic and Transport Properties	344
6.1 Thermodynamic Properties	344
6.2 Free Energies and Entropy Production	347
6.3 Transport Properties	350
7 Phase Diagrams and Phase Transitions	355
7.1 Bulk Fluids	355
7.2 Phase Transitions in Confined Systems	358
8 Complex Fluids	360
8.1 Colloids, Dendrimers, Alkanes, Biomolecular Systems, <i>etc.</i>	361
8.2 Polymers	367
9 Confined Fluids	376
9.1 Nanofluidics, Friction, Stick-Slip Boundary Conditions, Transport and Structure	377
9.2 Confined Complex Fluids	384
9.3 Simple Models	389
10 Water	391
11 Conclusions	392
References	392

Combinatorial Enumeration in Chemistry	405
<i>By A. Miličević and N. Trinajstić</i>	
1 Introduction	405
2 Current Results	405
2.1 Isomer Enumeration	405
2.2 Kekulé Structures	421
2.3 Walks	436
2.4 Structural Complexity	442
2.5 Other Enumerations	450
3 Conclusion	457
Acknowledgment	459
References	459

Many-Body Perturbation Theory and its Application to the Molecular Structure Problem	470
<i>By S. Wilson</i>	
1 Introduction	470
2 Computation and Supercomputation	472
2.1 The Role of Computation	473
2.2 Supercomputational Science	475
2.3 Literate Programming	476
2.4 A Literate Program for Many-Body Perturbation Theory	482
3 Increasingly Complex Molecular Systems	510
3.1 Large Molecular Systems	511
3.2 Relativistic Formulations	511
3.3 Multireference Formalisms	512
3.4 Multicomponent Formulations	514
4 Diagrammatic Many-Body Perturbation Theory of Molecular Electronic Structure: A Review of Applications	514
4.1 Incidence of the String “MP2” in Titles and/or Keywords and/or Abstracts	514
4.2 Comparison with Other Methods	517
4.3 Synopsis of Applications of Second Order Many-Body Perturbation Theory	519
5 Summary and Prospects	523
References	524
