

**Cover**

The icosahedral 'golden fullerene' W_{Au}_{12} reproduced by permission of Pekka Pyykkö, Chemistry Department, University of Helsinki, Finland.

Editorial announcement	13
<i>Alan Hinchliffe</i>	

Preface	15
<i>Michael Springborg</i>	

Polarizabilities and hyperpolarizabilities	17
<i>Benoît Champagne</i>	

Introduction	17
Theoretical frame and definitions of polarizabilities and hyperpolarizabilities	18
Brief overview of the methods for predicting and interpreting polarizabilities and hyperpolarizabilities	20
Methodological developments and new implementations	22
<i>Ab initio</i> methods	22
Electron correlation effects and the density functional theory challenge	26
Pure vibrational and zero-point vibrational average contributions	28
Interpretation schemes	29
Other methods	30
Reviews of literature on linear and nonlinear responses of molecules to electric fields: June 2007–May 2008	31

Organic π -conjugated molecules	31
Open-shell systems and the intermediate diradical character paradigm	37
Polymer chains	40
Pure vibrational and zero-point vibrational average contributions	42
Atoms and small molecules	43
Clusters	45
Organometallic compounds	47
Reviews of literature on mixed electric dipole—electric quadrupole—magnetic dipole responses: June 2007–May 2008	48
Buckingham birefringence	48
Magneto-optical rotation and magnetic circular dichroism	48
Electric quadrupole polarizabilities of nuclear magnetic shieldings	49
Nuclear magnetoelectric shielding	50
Dipole-quadrupole and dipole-octopole polarizabilities	51
Reviews of literature on resonant responses of molecules to electromagnetic fields: June 2007–May 2008	52
Two-photon absorption	52
Two-photon circular dichroism	53
Reviews of literature on linear and nonlinear responses of molecular aggregates and solid phases: June 2007–May 2008	53
Selected challenges	55

Spin-polarized reactivity indices from density functional theory: theory and applications 63

Frank De Proft, Eduardo Chamorro, Patricia Pérez, Mario Duque, Freija De Vleeschouwer and Paul Geerlings

Introduction: density functional theory: computational vs. conceptual aspects	63
Conceptual DFT: perturbational perspective on chemical reactivity	67
Spin-resolved conceptual DFT: introductory remarks and different representations	73
Key spin-polarized reactivity indices	76
Global quantities	76
Local reactivity indicators	82
Non-local reactivity indicators	86
Generalized philicity concepts	88
Nuclear reactivity indices in the spin-resolved framework	90
Applications	91
Properties of atoms and spin-polarized molecular systems	91
Studies of reactions involving spin-polarized systems	98
Conclusions	106

QSAR—old and new directions	112
<i>Michael C. Hutter</i>	
Introduction	112
Correlation: causative or random	113
Descriptors: a never ending story	114
Predictivity, errors and outliers	121
Current and emerging mathematical methods	125
Conclusions	129
<hr/>	
Excitations	131
<i>Jan-Ole Joswig</i>	
Introduction	131
Methods	132
Density-based methods	133
Wavefunction-based methods	139
Some technical aspects	141
Excitations in various systems	144
Excitations in metal clusters	144
Excitations in semiconductor nanoparticles	147
Excitations in organic and biological systems	151
Identification of structure	154
Dynamics in excited states	157
Conclusions	158
<hr/>	
Wavefunction-based <i>ab initio</i> correlation method for metals: application of the incremental scheme to Be, Mg, Zn, Cd, and Hg	162
<i>Elena Voloshina and Beate Paulus</i>	
Introduction	162
Method of increments	165
General formalism	165
Modifications for applying the method of increments for metals	166
Properties of the embedding	168
Technical details	169
Influence of the embedding on the correlation energy	169
Small Mg-clusters <i>vs.</i> bulk magnesium	169
Dependence of the correlation energy with the basis set and the size of the embedding cluster: Anomalous behaviour of beryllium	174
Multi-reference character of barium	177
Metallic binding due to correlations: Mercury, zinc, and cadmium	179
Unusual crystal structures	179

Ground-state properties: mean-field results	180
Origin of the cohesion in the solid mercury	184
Lattice structure of mercury: influence of electronic correlation	187
Binding properties of Zn and Cd: explicit treatment of electronic correlations	191
Multiple minima on the energy landscape of elemental zinc	200
Conclusion and outlook	203

Numerical methods in chemistry	210
---------------------------------------	-----

Theodore E. Simos

A. A new methodology for the development of numerical methods for the numerical solution of the Schrödinger equation	210
Introduction	210
Phase-lag analysis of symmetric multistep methods	211
The new families of numerov-type hybrid methods—construction of the new methods	211
First family of methods	211
Second family of methods	216
Third family of methods	220
Error analysis	227
Stability analysis	230
Numerical example	237
Resonance problem	238
Conclusions	241
B. New trigonometrically fitted six-step symmetric methods for the efficient solution of the Schrödinger equation	243
Basic theory	243
Exponential symmetric multistep methods	243
Stability analysis of symmetric multistep methods	243
Construction of the new trigonometrically fitted multistep methods	244
Analysis of the new methods	254
Numerical example	257
Resonance problem	257
Conclusions	259
Comments on recent bibliography	260
Appendix A	269
Appendix B	273
Appendix C	280
Appendix D	292
Appendix E	315
Appendix F	341
Appendix G	361
Appendix H	372

Appendix I	384
Appendix K	402
Appendix L	436
Appendix M	450
Appendix N	466
Appendix O	481

Nanostructures	510
-----------------------	-----

Michael Springborg

Introduction	510
Model systems	512
Alkali metals	518
Group III elements	522
Group IV elements	527
AB semiconductors	533
Gold	539
Other metals	548
More complex systems	559
Nanostructures on surfaces	562
Nanostructures as junctions	566
Conclusions	569
