

## How To Make Your Weather Observations As Good As They Can Be

### A Talk by Geoff Jenkins

- 7pm Wednesday, February 10<sup>th</sup>, 2016 (tea/coffee from 6:30pm)
- Inverness College, UHI Inverness Campus, IV2 5NA
- Free and open to all. Enquiries: [shonalmackie@gmail.com](mailto:shonalmackie@gmail.com)

### Abstract

For anyone with an interest in the weather, making your own observations will afford years of fascination, and there has never been a better time to start observing or upgrade the measurements you already make. Traditional manual instruments can be bought at budget prices online, and there is now a wide range of wireless automatic weather stations readily available from £50 to £1000 or more – even those at the lower end are surprisingly good and with a few tweaks can be improved, with lots of online forums and blogs to help you. Most AWS can communicate with your PC, which can store the data and also send it on to weather networks such as the Met Office's Weather Observations Website or Wunderground, where you can see it live online. And you don't need a large open estate; you can make useful observations from a tiny garden in suburbia (like mine) or the inner city. This talk will discuss all of the above.
