Supporting Information

All reactions, unless otherwise stated, were run under an atmosphere of nitrogen at ambient temperature (18-22 °C). 0 °C refers to an ice/water slush bath and -78 °C refers to a dry ice-acetone bath. Heated experiments were conducted using thermostatically controlled oil baths. Reactions were monitored by TLC using aluminium backed silica gel 60 (F254) plates, visualised using UV 254 and 2,4-dinitrophenylhydrazine, ninhydrin and potassium permanganate dips as appropriate. Flash column chromatography was carried out routinely using 60 Å silica gel (Merck). Reagents were used as received from commercial sources apart from the following exceptions, THF was distilled from sodium benzophenone ketyl, triethylamine was distilled from calcium hydride and formic acid was distilled from phthalic anhydride. NMR spectra were recorded on a Bruker DPX (300 or 400 MHz) spectrometer. Chemical shifts are reported in δ units, parts per million downfield from TMS. Coupling constants (J) are measured in hertz. IR spectra were recorded on a Perkin-Elmer spectrum One FT-IR Golden Gate. Mass spectra were recorded on a 7070E VG mass spectrometer. Melting points were recorded on a Stuart Scientific SMP 1 instrument and are uncorrected.

Synthesis of t-butyl-2-(4,5-dimethoxy-2-hex-5-oxoylphenyl)-ethylcarbamate (7)
To a suspension of Mg turnings (0.29 g, 11.2 mmol) in THF (5 mL) was added a solution of 5-bromopent-1-ene (1.36 g, 9.1 mmol) in THF (5 mL) followed by a single crystal of iodine, the mixture was heated under reflux for 2 h and then cooled to rt. The Grignard solution was added to a solution of t-butyl-6,7-dimethoxy-1-oxo-3,4-dihydroisoquinoline-2(1H)-carboxylate (2.0 g, 6.5 mmol) in THF (40 mL) in one portion at rt. The resulting mixture was stirred for 1 h, 2 M HCl was added to acidify (pH 1-2) and the phases separated, the aqueous phase was further extracted with DCM (3 × 30 mL). The organics were combined, dried (Na2SO4) and evaporated under reduced pressure to afford a yellow oil which was purified by flash column chromatography (SiO2, EtOAc-Hexanes 15:85) to afford t-butyl-2-(4,5-dimethoxy-2-hex-5-oxoylphenyl)-ethylcarbamate (1.75 g, 71 %) as a white solid; mp 42-44 °C; (Found: C, 66.78; H, 8.29; N, 3.80. t-Butyl-2-[4,5-dimethoxy-2-(5-oxopentanoyl)phenyl]-ethylcarbamate (0.10 g, 0.26 mmol) was stirred in freshly distilled formic acid (0.9 mL) for 1 h. The flask was then sealed and cooled to 0 °C; triethylamine (0.15 mL) was added cautiously with vigorous shaking until all gas had redissolved.
