Selected NMR spectra .................. page 11-19
General:

All operations were performed in an atmosphere of dry argon by using Schlenk and vacuum techniques. All solvents were purified by standard methods and distilled prior to use. $^1$H and $^{13}$C NMR spectra were recorded on Bruker DPX 200, Bruker DPX 400 and Bruker AV 600 devices. The chemical shifts are given in ppm relative to TMS. The spin coupling patterns are indicated as s (singlet), d (doublet), m (multiplet), sept (septet) and br (broad, for unresolved signals). Elemental analyses (C, H, N) and IR-spectroscopy analysis were performed on a Elementar Vario EL elemental analyzer and on a Bruker Vertex 70 ATR. ESI-MS in Methanol and EI-MS spectra were recorded on a thermoquest MAT 95 XLT and a Finnigan MAT 90 device. Potassium bis(trimethylsilyl)amide, perchloric acid and tetrafluoroboric acid was received from Aldrich and Merck. The tetrachlorocyclopropene was prepared according to literature procedures.¹

Preparation of the Compounds

Bis[bis(R-1-phenylethyl)amino]cyclopropenylum-perchlorate, (1)ClO4

At room temperature (+)-Bis[(R)-1-phenylethyl]amine (0.044 mol, 10 g) was added to a stirred solution of tetrachlorocyclopropene (0.01 mol, 1.8 g) in CH2Cl2 (60 ml). After 24 hours, perchloric acid (70 % in water, 0.13 ml) was added to the yellow solution at room temperature, and the reaction mixture was subsequently stirred for 8 hours at room temperature. After the addition of triphenylphosphine (0.0115 mol, 3.00 g), water (150 ml) was immediately added to the solution, and the mixture was stirred overnight. The organic layer was separated, washed with water, dried over MgSO4 and concentrated under vacuum. The crude oily product was recrystallized at -26°C from CH2Cl2/Et2O/pentane (1/3/1) affording (1)ClO4 as a white solid.

Yield: 2.92 g, 50%. 1H NMR (400 MHz, CDCl3): δ = 1.71 (d, J = 7.1, 6H, CH2CH), 1.77 (d, J = 7.1, 6H, CH2CH), 4.67 (dq, J = 7.1, 4H, NCH), 6.72 (m, 4H, CHaryl), 6.89 (m, 4H, CHaryl), 7.10-7.21 (m, 12H, CHaryl), 7.37 (s, 1H, C ring); 13C NMR (100 MHz, CDCl3): δ = 18.64 (CH2CH), 18.76 (CH2CH), 60.11 (NCH) 60.57 (NCH), 102.64 (CHring), 127.14 (CHaryl), 127.75 (CHaryl), 128.71 (CHaryl), 128.89 (Caryl), 128.95 (CHaryl), 129.05 (CHaryl), 135,38 (Cring), 136.89 (Caryl), 137.27 (Caryl); elemental analysis: theoretical: N 4.78, C 71.82, H 6.37, found: N 4.76, C 71.64, H 6.33; MS (ESI), m/z (%): 485,4 (100, [C35H37N2 ClO4]+), 486,4 (41), 487,4 (10); IR (ATR) cm⁻¹: 1556 (vs, C=N stretching), 1867 (m, ring deformation).

Bis[bis(R-1-phenylethyl)amino]cyclopropenylum-tetrafluoroborate, (1)BF4

The procedure is analogous to the preparation of (1)ClO4: (+)-Bis[(R)-1-phenylethyl]amine (0.044 mol, 10 g) tetrachlorocyclopropene (0.01 mol, 1.8 g), tetrafluoroboric acid solution (50 wt. % in water, 1.37 ml, 0.879 g) triphenylphosphine (0.0115 mol, 3 g). The resulting product was a white solid of (1)BF4. Yield: 5.2 g, 90%. 1H NMR (200 MHz, CDCl3): δ = 1.82 (d, J = 7.1, 6H, CH2CH), 1.88 (d, J = 7.1, 6H, CH2CH), 4.84 (dq, J = 7.1, 4H, NCH), 6.83 (m, 4H, CHaryl), 7.00 (m, 4H, CHaryl), 7.22-7.33(m, 12H, CHaryl), 7.51 (s, 1H, CHring); 13C NMR (50 MHz, CDCl3): δ = 18.61 (CH2CH), 60.04 (NCH), 60.55 (NCH), 102.78 (CHring), 127.14 (CHaryl), 127.75
Bis[bis(R-1-phenylethyl)amino]cyclopropenylidene (2)

A mixture of (1)BF₄ (1.4 mmol, 800 mg) and potassium bis(trimethylsilyl)amide (1.4 mmol, 280 mg) was cooled to -90°C, and pre-cooled (-60°C) Et₂O was added. The suspension was stirred for 30 min at -85°C and subsequently allowed to warm up to ambient temperature over a period of 3 hours. After evaporation of the solvent under vacuum, hexane (30 ml) was added, and the suspension was stirred for 15 min. After filtration of the suspension, the orange solution was left in a refrigerator at -35°C overnight to obtain an amber colored powder. The solid was isolated by decantation of the mother liquor and dried under vacuum. Crystals were obtained from hexamethyldisiloxane solution at 1°C. Yield: 670 mg, 60%. ¹H NMR (400 MHz, THF-d₈): δ = 1.68 (d, J = 6.7, 12H, CH₃CH), 4.62 (q, J = 7.05, 4H, NC₆H), 6.94-6.99 (m, 12H, CH₂aryl), 7.05-7.08 (m, 8H, CH₂aryl); ¹³C NMR (100 MHz, THF): δ = 19.96 (CH₃CH), 59.84 (NCH), 127.52 (CH₂aryl), 128.56 (CH₂aryl), 128.73 (CH₂aryl), 142.93 (Caryl), 160.77 (Cring), 188.20 (Ccarbene); elemental analysis: theoretical: N 5.78, C 86.73, H 7.49, found: N 5.49, C 85.99, H 7.73; MS (EI), m/z (%): 105 (100, [C₈H₉⁺]), 379 (4, [C₂₇H₂₇N₂⁺]), 484 (2, [M⁺]), IR (ATR) cm⁻¹: 1431 (vs, C-N stretching), 1821 (m, ring deformation).

Bis(cyclopropenylidene-silver(I) complex [(2)₂Ag]BF₄ (3)

At room temperature, Ag₂O (0.55 mmol, 130 mg), (1)BF₄ (1.1 mmol, 640 mg) and a catalytic amount of Me₄BF₄ was added to a stirred solution of CH₂Cl₂ (40 ml). Subsequently, the flask was kept in the dark. After 30 min 1 M NaOH aqueous solution (40 ml) was added to this suspension. The mixture was stirred for 24 hours at room temperature. The organic layer was separated and the aqueous layer washed with CH₂Cl₂. The organic layers were
combined and dried over MgSO₄. After concentration under vacuum, a pale yellow solid was obtained. The crude product was precipitated at -26°C from CH₂Cl₂/pentane. Crystals were obtained from CH₂Cl₂/Et₂O/pentane (1/2/5) at 1°C. ¹H NMR (600 MHz, CDCl₃): δ = 1.72 (broad s, 12H, CH₃CH), δ = 1.85 (broad s, 12H, CH₃CH), 4.61 (broad s, 4H, NCH), 4.91 (broad s, 4H, NCH), 6.74 (broad s, 8H, CH₃aryl), 7.06-7.11 (broad s, 32H, CH₃aryl); ¹³C NMR (150 MHz, CDCl₃): δ = 18.94 (CH₃CH), 19.91 (CH₃CH), 58.45 (NCH), 127.31 (CH₃aryl), 127.75 (CH₃aryl), 128.45 (CH₃aryl), 138.10 (Caryl), 140.12 (Caryl), 146.2 (d, C Ring), 150.77 (C Ring); elemental analysis: theoretical: N 4.81, C 72.23, H 6.23, found: N 4.62, C 71.24, H 6.73; MS (ESI), m/z (%): 1077.5 (100, [C₇₀H₇₂N₄Ag⁺]), 1077.5 (85), 1078.5 (65), 1076.5 (65), 1079.5 (25), 1080.5 (10); IR (ATR) cm⁻¹: 1491 (vs, C-N stretching), 1835 (m, ring deformation)
