1. General

1.1. Equipment and chemicals used

All reactions were carried out under Ar in pre-dried glassware using Schlenk techniques. The anhydrous solvents were dried by distillation over CaH₂ and were transferred under argon: (E)-1,2-dichloroethene (Fluka), (Z)-1,2-dichloroethene (Aldrich, contains 15% mol of E isomer), CH₂Cl₂.

Flash column and preparative thin layer chromatographies were performed using silica gel 60 (230–400 mesh). NMR spectra were recorded in CDCl₃; chemical shifts (δ) are given in ppm relative to TMS, coupling constants are (J) in Hz. IR spectra: wavenumbers are in cm⁻¹. MS (EI, LSIMS) spectra were recorded on AMD 604 Intectra GmbH spectrometer. MS (ESI) spectra were recorded on Mariner Perseptive Biosystems, Inc. GC/MS measurements were done on HP 5890 with HP 5 column.

Micro-analyses were provided by Institute of Organic Chemistry, PAS, Warsaw.

Catalysts 1a and 1b were purchased from Aldrich and used as received. Complexes 1c and 1d were prepared according to literature methods. All other commercially available chemicals were used as received.

1.2. Analytical methods

Comparative CM experiments with diene 5a (refer to Scheme 1): To a stirred solution of diene 5a (0.2 mmol, 26.8 mg) and durene (used as an internal standard, 0.1 mmol) in (E)-1,2-dichloroethene (100 equiv., 1.6 mL) placed under argon in a Schlenk tube a catalyst (0.001–0.005 mmol) was added in a single portion at room temperature and the reaction mixture was refluxed for 20 h. Reaction mixtures were immediately analysed by GC, using HP 6890 chromatograph with HP 5 column. The responses of the FID detector were calibrated using 5a/durene and 7a/durene standard solutions. Each CM experiment was repeated at least two times.

2. Experimental section

2.1. General procedure for CM reactions

To a solution of alkene (0.60 mmol) in (E)-1,2-dichloroethene (100 equiv., 4.6 mL) was added a Ru-catalyst as a solid by portions (one portion per hour) or in one portion (0.03–0.09 mmol, 5.0–15.0 mol%). The resulting mixture was refluxed for 6–24 h. The solvent was removed under reduced pressure. The crude product was purified by flash or preparative thin layer chromatography (c-hexane/EtOAc).

2.2. Characterisation data

1-[\(E,Z\)]-2-Chloroethyl]-4-methoxybenzene (7a)
The crude product was purified by preparative thin layer chromatography (c-hexane/EtOAc = 20:1). Colorless oil (91%). Mixture of isomers, Z:E = 5:1.
