1. General Experimental Section

$^1$H NMR spectra were recorded on Bruker AC 200 and DPX 400 spectrometers at 200 and 400 MHz respectively and referenced to residual solvent. $^{13}$C NMR spectra were recorded at 50 and 100 MHz on the same spectrometers. Chemical shift data are quoted in parts per million ($\delta$ in ppm), $J$ values are given in Hz and s, d, dd, t, q and m represent singlet, doublet, doublet of doublet, triplet, quartet and multiplet. Mass spectra were obtained on a Thermoquest Automass BenchTop mass spectrometer at Heriot-Watt University and a Finnigan MAT 900 XLT at the EPSRC National Mass Spectrometry Service Centre in Swansea. Flash column chromatography was carried out using Matrix silica gel 60 from Fisher Chemicals and TLC was performed using Merck silica gel 60 F254 pre-coated sheets and visualised by UV (254 nm) or stained by the use of aqueous acidic KMnO$_4$ or aqueous acidic ammonium molybdate as appropriate. Chemicals were purchased from Aldrich and Fisher chemical companies and used without further purification unless otherwise stated. Tetrahydrofuran was dried by distillation from sodium – benzophenone under nitrogen, dimethylsulfoxide, acetonitrile, toluene, ethynyltrimethylsilane and dichloromethane were dried over calcium hydride. Petrol ether refers to petroleum ether (40 – 60 %).
2. Experimental Procedures

Cyclopropane 1 was synthesized following a general procedure by Gevorgyan (Scheme 1).\(^1\,^2\)

**1,1-Dibromo-2-methyl-2-nonylcyclopropane S-1**

Bromoform (30.9 g, 122 mmol) and dichloromethane (5 mL) were added dropwise to a stirring mixture of aqueous sodium hydroxide (30 mL, 11.2 g, 280 mmol), cetrimide (2.52 g), 2-methylundec-1-ene (10.3 g, 61.2 mmol) and dichloromethane (10 mL). The mixture was allowed to stir at 25 °C. After 48 h, the reaction mixture was diluted with water (75 mL). Dichloromethane (30 ml) was added and the layers partitioned. The aqueous layer was washed twice with dichloromethane (30 ml). The combined organic layers were washed with brine (50 mL), dried over magnesium sulphate and concentrated under reduced pressure. The resulting material was purified by flash column chromatography (hexanes) and the remaining bromoform was evaporated under high vacuum (10 h, 30 °C) to yield 1,1-dibromo-2-methyl-2-nonylcyclopropane S-1 (16.8 g, 49.5 mmol, 81%) as a colourless oil.

2-Bromo-1-methyl-1-nonylcyclopropane S-2

A solution of ethylmagnesium bromide (1.38 M in Et₂O, 38.6 mL, 53.3 mmol) was added over 1 hour to a stirring solution of 1,1-dibromo-2-methyl-2-nonylcyclopropane S-1 (14.1 g, 41.5 mmol), Ti(OiPr)₄ (0.235 g, 0.827 mmol) and tetrahydrofuran (100 mL). The solution was allowed to stir for an additional hour at 20 °C. The reaction was quenched by slow addition of water (20 mL), then 20% aqueous sulphuric acid (50 mL) was added and the mixture stirred for 30 minutes. Diethyl ether (50 mL) was added and the layers were partitioned. The aqueous layer was washed further three times with diethyl ether (50 mL). The combined organic layers were washed twice with saturated sodium bicarbonate (50 mL), washed with brine (50 mL), dried over magnesium sulphate and concentrated under reduced pressure. The crude material was purified by flash column chromatography (eluent: petrol ether) to yield a mixture of the two diastereomers of 2-bromo-1-methyl-1-nonylcyclopropane S-2 (8.25 g, 31.6 mmol, 77%) as a colourless oil.

3-Methyl-3-nonylecycloprop-1-ene 1

Potassium tert-butoxide (1.72 g, 15.3 mmol) and dimethyl sulfoxide (23 mL) were heated to 50 °C and allowed to stir for 30 minutes at this temperature. The solution was cooled to room temperature and 2-bromo-1-methyl-1-nonylecyclopropane **S-2** (2.50 g, 9.58 mmol) was added dropwise. The reaction mixture was allowed to stir for 22 h at 25 °C, then quenched by addition of water (100 mL). Pentane (500 mL) was added and the layers partitioned. The aqueous layer was washed three times with pentane (50 mL). The combined organic layers were washed twice with brine (100 mL), dried over magnesium sulphate and concentrated under reduced pressure. The resulting material was purified by flash column chromatography (pentane) to yield 3-methyl-3-nonylecycloprop-1-ene **1** (1.00 g, 5.55 mmol, 58%) as a colourless oil.

**General Procedure: Gold(I) catalysed addition of alcohols to cyclopropene 1**

**Method A:** Ph$_3$PAuCl (5 mol%) and AgOTf (5 mol%) were added to a solution of 3-methyl-3-nonylcycloprop-1-ene 1 (1 eq.) and ROH (6 eq.) in dichloromethane (0.55 M). The reaction mixture was allowed to stir for 1-2 h at 20 °C. The solvent was evaporated and the residue was purified by flash column chromatography to yield the corresponding tert-allylic ether product.

**Method B:** Ph$_3$PAuNTf$_2$ (as the 2:1 toluene adduct) (5 mol%) was added to a solution of 3-methyl-3-nonylcycloprop-1-ene 1 (1 eq.) and ROH (6 eq.) in dichloromethane (0.55 M). The reaction mixture was allowed to stir for 1-2 h at 20 °C. The solvent was evaporated and the residue was purified by flash column chromatography to yield the corresponding tert-allylic ether product.

§ t-BuOH was added as a co-solvent to homogenize the layers. In the absence of t-BuOH co-solvent, a lower yield of 17% was observed. This lower yield is probably due to the biphasic nature (H$_2$O/CH$_2$Cl$_2$) of the resulting reaction mixture.

Control Reactions

**Catalyst: Trifluoromethanesulfonic acid**
Trifluoromethanesulfonic acid (21 µL of a 0.666 M solution in dichloromethane, 14.0 µmol) were added to a solution of 3-methyl-3-nonylcycloprop-1-ene 1 (48.9 mg, 0.271 mmol) and ethanol (77.2 mg, 1.68 mmol) in dichloromethane (0.5 mL). The reaction mixture was allowed to stir at 20 °C. After 1.5 h the reaction was monitored by TLC (eluent: 90% petrol ether, 10% diethyl ether) and there was no sign of any product formed. After a further 22.5 h at 20 °C the solvent was evaporated and the residue was filtered through a silica short plug (diethyl ether). Analysis of the crude mixture by 1H-NMR (200 MHz, CDCl₃) showed that no reaction took place (>95% of starting material).

**Catalyst: AgOTf**
AgOTf (3.7 mg, 14.4 µmol) was added to a solution of 3-methyl-3-nonylcycloprop-1-ene 1 (48.3 mg, 0.268 mmol) and ethanol (70.1 mg, 1.72 mmol) in dichloromethane (0.5 mL). The reaction mixture was allowed to stir at 20 °C. After 1.5 h the reaction was monitored by TLC (eluent: 90% petrol ether, 10% diethyl ether) and only traces of product were detected. After a further 22.5 h at room temperature the solvent was evaporated and the residue was filtered through a silica short plug (diethyl ether) to give 48.4 mg of a mixture of unreacted 1:2b (7:4 ratio) along with traces of 3b, 4, 5 and other unidentified by-products. The products were identified and ratios determined by 1H-NMR (200 MHz, CDCl₃).

**Catalyst: Rh(OAc)₂**
[Rh(OAc)₂]₂ (3.1 mg, 7.01 µmol) was added to a solution of 3-methyl-3-nonylcycloprop-1-ene 1 (47.3 mg, 0.262 mmol) and ethanol (76.3 mg, 1.66 mmol) in dichloromethane (0.5 mL). The reaction mixture was allowed to stir at 20 °C. After 1.5 h the reaction was
monitored by TLC (eluent: 90% petrol ether, 10% diethyl ether) and only traces of products were detected. After a further 22.5 h at 20 °C the solvent was evaporated and the residue was filtered through a silica short plug (diethyl ether) to give 18.4 mg of a mixture of 4 and 5 along with traces of 3b and 2b. The products were identified by 1H-NMR (200 MHz, CDCl3) analysis of the crude mixture.

**Catalyst: AuCl3**

AuCl3 (1.7 mg, 5.60 μmol) was added to a solution of 3-methyl-3-nonylcycloprop-1-ene 1 (21.7 mg, 0.120 mmol) and ethanol (34.7 mg, 0.753 mmol) in dichloromethane (0.2 mL). The reaction mixture was allowed to stir at 20 °C. After 1.5 h the reaction was monitored by TLC (eluent: 90% petrol ether, 10% diethyl ether) and only traces of product were detected. After a further 22.5 h at 20 °C the solvent was evaporated and the residue was filtered through a silica short plug (diethyl ether) to give 25.3 mg of a mixture mainly 4 and 5 along with traces of 2b, 3b and other unidentified by-products. The products were identified by 1H-NMR (200 MHz, CDCl3) analysis of the crude mixture. Purification by column chromatography (9:1 hexane:ether) produced a mixture of 4 and 5 as a colourless oil (12 mg, 61 μmol, 50%).

**tert-Butanol as solvent instead of dichloromethane**

Ph$_3$PdNTf$_2$ (as the 2:1 toluene adduct) (3.3 mg, 2.10 µmol) was added to a solution of 3-methyl-3-nonylcycloprop-1-ene 1 (14.2 mg, 78.7 µmol) and ethanol (23.5 mg, 0.510 mmol) in tert-butanol (0.2 mL). The reaction mixture was allowed to stir for 1.5 h at 20 °C. Then the solvent was evaporated and the residue was filtered through a silica short plug (diethyl ether) to give 13.5 mg of a mixture of mainly unreacted 1 (~90%), 2b (~5%) and 2h (~5%) as a colourless oil. The products were identified and ratios determined by $^1$H-NMR (200 MHz, CDCl$_3$) analysis of the crude mixture. [N.B. The catalyst did not seem to completely dissolve in this solvent mixture.]

**1.5 Equivalents of ethanol (instead of 6 equivalents)**

Ph$_3$PdNTf$_2$ (as the 2:1 toluene adduct) (11.2 mg, 7.13 µmol) was added to a solution of 3-methyl-3-nonylcycloprop-1-ene 1 (52.0 mg, 0.288 mmol) and ethanol (20.4 mg, 0.443 mmol) in dichloromethane (0.5 mL). The reaction mixture was allowed to stir for 1.5 h at 20 °C. Then the solvent was evaporated and the residue was filtered through a silica short plug (diethyl ether) to give 62.0 mg of a mixture of 2b, 3b (4:1 ratio) and unidentified by-products as a colourless oil. The products were identified and ratio determined by $^1$H-NMR (200 MHz, CDCl$_3$) analysis of the crude mixture.

**1.1 Equivalents of ethanol and 5 equivalents tert-butanol (instead of 6 equivalents of ethanol)**

Ph$_3$PdNTf$_2$ (as the 2:1 toluene adduct) (4.4 mg, 2.80 µmol) was added to a solution of 3-methyl-3-nonylcycloprop-1-ene 1 (20.5 mg, 0.114 mmol), ethanol (5.8 mg, 0.126 mmol) and tert-butanol (44.3 mg, 0.598 mmol) in dichloromethane (0.2 mL). The reaction mixture was allowed to stir for 1.5 h at 20 °C. Then the solvent was evaporated
and the residue was purified by flash column chromatography (90% petrol ether, 10% diethyl ether) to yield 2b (16.5 mg, 72.9 µmol, 64%) as a colourless oil.

**Reaction time of 10 min**

Ph3PAuNTf2 (as the 2:1 toluene adduct) (4.7 mg, 2.99 µmol) was added to a solution of 3-methyl-3-nonylcycloprop-1-ene 1 (21.1 mg, 0.117 mmol) and ethanol (33.1 mg, 0.718 mmol) in dichloromethane (0.2 mL). The reaction mixture was allowed to stir for 10 min at 20 °C. The solvent was evaporated and the residue was filtered through a silica short plug (diethyl ether) to yield 2b as colourless oil (24.1 mg, 0.106 mmol, 91%).

**1 mol% catalyst**

Ph3PAuNTf2 (as the 2:1 toluene adduct) (0.9 mg, 0.573 µmol) was added to a solution of 3-methyl-3-nonylcycloprop-1-ene 1 (23.2 mg, 0.129 mmol) and ethanol (37.3 mg, 0.809 mmol) in dichloromethane (0.2 mL). The reaction mixture was allowed to stir for 1.5 h at 20 °C. The solvent was evaporated and the residue was filtered through a silica short plug (diethyl ether) to yield 2b as colourless oil (28.7 mg, 0.127 mmol, 98%).

3. Mechanistic Proposals

Mechanistic proposal for the gold(I)-catalysed formation of 8 and 9 from cyclopropene 7:

For Ar-substituted cyclopropenes 10b-d, one regioisomer of furanone 11b-d is detected. Mechanistic proposal for the gold(I)-catalysed formation of 11 from cyclopropenes 10b:

It is of note that 3,3-keto,ester-disubstituted cyclopropene S-5, which is known to undergo rearrangement to furans under Cu(I) and Pd(II) catalysis, fails to react under Au(I) catalysis, thereby suggesting a different mechanistic pathway from Cu(I) and Pd(II). Our proposed mechanism is consistent with this result: the corresponding vinyl carbenoid/cation is now disfavoured, since this places a carbocation next to the δ+ carbon atom (β to two carbonyl groups):
