Characterization

$^1$H NMR spectra were recorded on a Varian Unity plus-400 spectrometer (400 MHz). An UV-vis scanning spectrophotometer (TU1900, Beijing Purkinje General Instrument Co., Ltd) was utilized to obtain the UV-vis spectra of the monomer and polymer samples at 25 °C. The thermal back-isomerization of the solution of P10 in THF was investigated by firstly irradiating it with a 365 nm UV lamp (12 w) for 4 min until the photostationary state was reached and then the UV-vis spectrum of the polymer solution in the dark was measured in different time at 25 °C. The liquid crystalline textures of the polymer films were observed by using an Olympus BX51 polarizing optical microscope (POM) equipped with a Linksys 32 THMSE600 hot stage and a digital camera (Micropublisher 5.0 RTV). The reversible photoisomerization of the crosslinked polymer film was studied by exposing the film to alternating UV (365 nm light) and visible light irradiation (430 < $\lambda$ < 550 nm).
