Experimental details

Horseradish peroxidase, glucose oxidase, and 2, 2’-azinobis (3-ethylbenzthiazoline-6-sulfonate acid) (ABTS) were purchased from Sigma-Aldrich. Other reagents were attained from Sinopharm Group Co. Ltd.

Preparation of AuNPs and HRP-AuNPs.

AuNPs solutions were prepared with the typical citrate reduction method as follows: 5 mL of 11.6 mg/mL trisodium citrate solution was added to a boiling, rapidly stirring solution of 50 mL, 0.826 mM HAuCl₄. The solution was kept boiling and stirring for another 30 min. After being cooled to room temperature overnight, the prepared AuNPs (concentration: ~11 nM) were stored at 4 °C. For preparation of HRP-AuNPs, 5 μL of HRP (Sigma-Aldrich) solution of certain concentration (1~10 μg/mL) was directly mixed with 45 μL as-prepared AuNPs. The mixture (containing 0.1~1 μg/mL HRP and 10 nM AuNPs) was incubated at room temperature for 1 hour if not mentioned otherwise, and was then stored at 4 °C for further use.

Characterization of HRP-AuNPs.

The morphology of AuNPs was characterized with a Philips CM300 FEG transmission electron microscopy. The absorption spectra of AuNPs and HRP-AuNPs were determined with a HITACHI U-3010 UV-Vis spectrophotometer. Their sizes were measured using a dynamic light scattering (DLS) particle sizer (Beckman Coulter Delsa Nano C A53878) at room temperature. The Fourier transform infrared spectroscopy (FTIR) measurements were carried out with a Thermo Nicolet Avatar 370 FTIR spectrophotometer.

Enzyme kinetic analysis.

For the enzyme assay, 50μL of HRP-AuNPs was mixed with 50μL 2, 2’-azinobis (3-ethylbenzthiazoline-6-sulfonate acid) (ABTS, Sigma-Aldrich) (1 mM in 10 mM sodium citrate buffer, pH 5.0) and 15 μL H₂O₂ of certain concentration. This mixture was incubated at 37°C for 10 min, whose absorbance (at 410 nm) was then read with a Tecan microplate reader.

Determination of gluconic acid.
AuNPs or HRP-AuNPs (0.1 μg/mL HRP vs. 10 nM AuNPs) were firstly let reacted with 20 μL glucose (0.5 M) for 30 min at 37 °C. Next, 250 μL of solution 1 (5 mM EDTA and 0.15 M Et_3N in water) and 25 μL of solution 2 (3 M NH_2OH in water) were added to the product solution, then the mixture was allowed to react for 15 min. After that, 125 μL of solution 3 (1 M HCl, 0.1 M FeCl_3, and 0.25 M CCl_3COOH in water) was added in to react for another 5 min. Finally the absorbance of the resulting mixture at 505 nm was recorded.

Detection of glucose.

The glucose detection was proceeded as follows: (1) 50 μL of HRP-AuNPs (0.1 μg/mL HRP vs. 10 nM AuNPs) and 20 μL glucose of certain concentration (0, 0.4, 0.8, 2, 4, 8, 20, 40, 80 mM) were mixed and incubated at 37 °C for 30 min; (2) 50 μL of 1 mM ABTS solution (pH 5.0) was then added to the solution, the mixture was allowed to react for another 10 min at 37 °C; (3) the absorbance (at 410 nm) of the resulting solution was measured with the microplate reader.
