SYNTHESIS OF BOSCALID HAPTENS BLb and BLc

General

All reactions involving air-sensitive compounds were conducted in oven-dried glassware under a nitrogen atmosphere. All solvents were purified by distillation and, if required, they were dried according to standard methods. tert-Butyl hex-5-ynoate (3) was prepared as described by Bartoli,¹ and tert-butyl 5-bromopentanoate (13) was synthesized as described by Mercader.² Compounds 1,3-diodobenzene (1), 4-chlorophenylboronic acid (5), 2-chloronicotinoyl chloride (9), 4-mercaptophenylboronic acid (11), 1-iodo-2-nitrobenzene (15), and all the other reagents used for the synthesis of the haptens were acquired from commercial sources and used without purification. The reactions were monitored with the aid of thin-layer chromatography (TLC) using 0.25 mm pre-coated silica gel plates. Visualization was carried out with UV light and aqueous ceric ammonium molybdate solution. Chromatography refers to flash column chromatography and it was carried out with the indicated solvents on silica gel 60 (particle size 0.040–0.063 mm). All melting points were determined using a Kofler hot-stage apparatus or a Büchi melting point apparatus and are uncorrected. All NMR spectra were recorded in CDCl₃ at room temperature on a Bruker AC-300 spectrometer (300.13 MHz for ¹H and 75.47 MHz for ¹³C). The spectra were referenced to residual solvent protons in the ¹H NMR spectra (7.26 ppm) and to solvent carbons in the ¹³C NMR spectra (77.0 ppm). Infrared (IR) spectra were measured as thin films between NaCl plates for liquid compounds and as KBr pellets for solids using a
Nicolet Avatar 320 spectrometer. High-resolution mass spectra (HRMS) were run either by the electron impact (EI, 70 eV) or fast atom bombardment (FAB), both obtained with a Micromass VG Autospec spectrometer, or the electrospray (ESI) mode, which was obtained with a Q-TOF premier mass spectrometer with an electrospray source (Waters, Manchester, UK).

**Synthesis of Hapten BLb**

*Preparation of 2,4-diiodo-1-nitrobenzene (2).* 1,3-Diodobenzene (1) (2.15 g, 6.55 mmol) was added in small portions to fuming HNO$_3$ (10 mL) cooled at 0 ºC. Once the addition had finished, the reaction mixture was stirred for 15 min at the same temperature, carefully poured into water and extracted with CH$_2$Cl$_2$. The organic extracts were washed successively with saturated NaHCO$_3$ solution, aqueous 5% NaHSO$_3$ solution, and brine. Drying over anhydrous MgSO$_4$ and removal of solvent gave a yellow solid that was purified by flash chromatography, using hexane-EtOAc 95:5 as eluent, to give the nitro derivative 2 (2.36 g, 94%) as a crystalline yellow solid. Preparation of tert-butyl 5-(2’-(2-chloronicotinamido)biphenyl-4-ylthio)pentanoate (18). A solution of aminobiphenyl 17 (100 mg, 0.28 mmol) and nicotinoyl chloride (9) (54 mg, 0.30 mmol) in anhydrous THF (1 mL) was stirred at rt for 3 h. After this time the solvent was removed under vacuum and the residue was purified by chromatography, eluting with hexane-Et₂O mixtures (from 8:2 to 2:8), to give amide 18 (120.3 mg, 87%) as an oil.
