SI 1: The first 10 principal components (PCs) of paraffin spectra (N=4941 spectra) obtained from the paraffin region of a single tissue section. The percentage of explained variance is denoted with each PC and the cumulative variance adds up to 98.79.
SI 2: Average spectra of pure paraffin image, paraffinized tissue, electronically de-paraffinized tissue and chemically deparaffinized tissues treated at different time points. Remnant paraffin is not visually apparent in the average spectra except T5 of paraffin oil.
