Scheme S1: Detection of methyl parathion based on the irreversible inhibition of the activity of acetylcholinesterase (AchE). AchE catalytically hydrolyzes acetylthiocholine iodide (ATCh) in phosphate buffer (pH = 8.0) to thiocholine that in turn dissociates dithio-bisnitrobenzoate (DTNB) to produce a yellow colored product (TNB).
Scheme S2: Dimensions of the barcode assay chip (not to the actual scale); the positions of the channels are highlighted with red dashed lines.
