Fig. S1 (a) Raman spectra of erythrocytes and (b) Raman spectra of hemoglobin excited by a near-infrared laser at 780 nm
**Fig. S2** (a) Raman spectra and the characteristic peak intensity (b) of hemoglobin under different pH environments

**Fig. S3** The enlarged panels of the characteristic Raman peaks at 1603 and 1616 cm$^{-1}$ of single erythrocytes under different blood pH conditions (acidosis: <7.4, alkalosis: >7.4, and normal: ~7.4); (a), (b) and (c) represent three replicates, respectively.
**Fig. S4** The linear graphs plotted by R\textsubscript{1603, 1616} with the extracellular pH ranging from 7.0 to 7.8 (R\textsuperscript{2}=0.985) and the distribution of the dots (pH, R\textsubscript{1603, 1616}) (gray) plotted by in vivo Raman measurements.

**Fig. S5** The distribution of the dots (pH, R\textsubscript{1603, 1616}) (gray) plotted by in vivo Raman measurements under different blood pH on the linear graph (black) plotted by in vitro Raman measurements; (a), (b) and (c) represent three replicates, respectively.
Fig. S6 The linear graphs plotted by $R_{1603,1616}$ with the extracellular pH ranging from 6.0 to 10.0
