Isotope Dilution Calibration Plots:

**Figure S1**: Isotope dilution calibration plot showing linearity of corrected DNS-ATX response over a broad concentration range in control algal extracts spiked with variable levels of DNS-ATX and 50 nM of d6-DNS-ATX. The inset shows an enlarged version of the three lowest level samples.
**Figure S2**: Isotope dilution calibration plot showing linearity of corrected DNS-hATX response over a broad concentration range in control algal extracts spiked with variable levels of DNS-hATX and 50 nM of d6-DNS-hATX. The inset shows an enlarged version of the three lowest level samples.
Figure S3: Isotope dilution calibration plot showing linearity of corrected DNS-DA response over a broad concentration range in control mussel extracts spiked with variable levels of DNS-DA and 2.4 μM of d6-DNS-DA. The inset shows an enlarged version of the three lowest level samples.
