A. Chemistry

Reagents and starting materials were obtained from commercial sources and used as received. Compounds 1 were synthesized according literature procedures.\textsuperscript{1} The solvents were purified and dried by standard procedures prior to use. Melting points were determined on an OptiMelt automated melting point system. NMR spectra were recorded on Bruker (400 MHz) spectrometer with chemical shifts values (δ) in ppm relative to TMS using the residual DMSO-\textit{d}_6 signal (\textsuperscript{1}H 2.50; \textsuperscript{13}C 39.52)\textsuperscript{2} as an internal standard.

General procedure for the synthesis of 2-alkyl-3-oxo-2,3-dihydro-1,2-benzothiazole-6-sulfonamide 1,1-dioxides (2-alkyl-6-sulfamoylsaccharines)

6-Sulfamoylsaccharin (0.50 g, 1.91 mmol) was suspended in H\textsubscript{2}O (20 mL). K\textsubscript{2}CO\textsubscript{3} (0.13 g, 0.95 mmol) was slowly added with stirring to the reaction mixture. Reaction mixture was evaporated and the residue was suspended in DMF (10 mL). The corresponding bromide (1.91 mmol) was added. The reaction mixture was stirred at 90 \textdegree C for 16 h. After cooling to room temperature CH\textsubscript{2}Cl\textsubscript{2} (20 mL), water (20 mL), and 2 M HCl (20 mL) were added, and the product was then extracted with CH\textsubscript{2}Cl\textsubscript{2}.
(3×20 mL), washed with brine (30 mL), and dried over Na$_2$SO$_4$. CH$_2$Cl$_2$ was evaporated leaving DMF solution. Addition of H$_2$O gave a precipitate which was collected by filtration and dried in vacuum.

\section*{B. Protein x-ray crystallography}

\subsection*{Materials and methods}

\textbf{Protein production and purification.} hCA II was produced and purified essentially as described earlier by our groups.\(^3\)

\textbf{Crystallization and data collection.}

Protein was concentrated to 10 mg/ml in 20 mM tris-HCl pH 8.0 using 10 kDa cutoff Amicon concentrator. Crystallization was done by hanging drop technique in EasyXtal 15-well Tool plates (Qiagen). 5\( \mu \)l of protein was mixed with 5\( \mu \)l of bottom solution and 0.2 \( \mu \)l of 100 mM inhibitor in 100% DMSO. Bottom solution contained 1.54M Na citrate, 60 mM tris-HCl pH 9.0. Protein crystals were flash-frozen in liquid nitrogen without addition of extra cryoprotectant.

Data were collected at beamline I911-3, MAX-lab synchrotron, Lund, Sweden.

\textbf{Structure determination.}

Images were processed by MOSFLM\(^4\) and scaled by SCALA\(^5\). The structures were refined by REFMAC\(^6\) using hCA II structure in complex with sulfonamide class inhibitor (PDB code 4BF1)\(^7\) as an initial model. The parameter files for inhibitors 2i, 2e and 2d were generated by LIBCHECK\(^8\). The ligand was fitted in electron density in COOT\(^9\), followed by further REFMAC runs. Data scaling, refinement, and validation statistics are listed in Table 1. Atomic coordinates and structure factors were deposited in PDB with accession code 5AMD, 5AML and 5AMG for complexes hCAII-2i/3i, hCAII-2e/3e and hCAII-2d/3d, respectively.

C. CA Inhibition

An Applied Photophysics stopped-flow instrument has been used for assaying the CA catalysed CO\textsubscript{2} hydration activity.\textsuperscript{10} Phenol red (at a concentration of 0.2 mM) has been used as indicator, working at the absorbance maximum of 557 nm, with 20 mM Hepes (pH 7.5) as buffer, and 20 mM Na\textsubscript{2}SO\textsubscript{4} (for maintaining constant the ionic strength), following the initial rates of the CA-catalyzed CO\textsubscript{2} hydration reaction for a period of 10–100 s. The CO\textsubscript{2} concentrations ranged from 1.7 to 17 mM for the determination of the kinetic parameters and inhibition constants. For each inhibitor at least six traces of the initial 5–10% of the reaction have been used for determining the initial velocity. The uncatalyzed rates were determined in the same manner and subtracted from the total observed rates. Stock solutions of inhibitor (0.1 mM) were prepared in distilled-deionized water and dilutions up to 0.01 nM were done thereafter with the assay buffer. Inhibitor and enzyme solutions were preincubated together for 15 min at room temperature prior to assay, in order to allow for the formation of the E–I complex. The inhibition constants were obtained by non-linear least-squares methods using PRISM 3, as reported earlier,\textsuperscript{11} and represent the mean from at least three different determinations. All CA isofoms were recombinant ones obtained in-house as reported earlier.\textsuperscript{3,11,12}
