Materials and Methods

All commercial materials (Alfa Aesar, Aladdin, J&K Chemical LTD.) were used without further purification. All solvents were analytical grade. The $^1$H-NMR and $^{13}$C-NMR spectra were recorded on a Bruker 400 MHz spectrometer in CDCl$_3$ using TMS or solvent peak as a standard. All $^{13}$C-NMR spectra were recorded with complete proton decoupling. Low-resolution mass spectral analyses were performed with a Waters AQUITY UPLC$^\text{TM}$/MS. All reactions were carried out in oven-dried sealed tube. Analytical TLC was performed on Yantai Chemical Industry Research Institute silica gel 60 F254 plates and flash column chromatography was performed on Qingdao Haiyang Chemical Co. Ltd silica gel 60 (200-300 mesh). The rotavapor was BUCHI’s Rotavapor R-3.

$^a$Conversion ratio determined by $^1$H NMR using 4-Nitrobenzaldehyde as internal standard.
$^b$DMF as the solvent, 36h. $^d$t-AmOH/DMF, 20h.$^e$AcOH as the solvent, 12h.

General procedure

I Synthesis of carbamates$^[1]$

A mixture of the phenol (1.0 equiv) and Me$_2$NCOCl (1.5 equiv) and K$_2$CO$_3$ (1.5 equiv) in MeCN was refluxed for 6 h. The reaction mixture was cooled to room temperature and concentrated under a vacuum. The residue was dissolved in H$_2$O and extracted with dichloroethane. The organic fractions were combined and then washed successively with 1 N NaOH and water. Finally the organic layer was separated, dried over anhydrous Na$_2$SO$_4$, and concentrated under a vacuum to yield the corresponding carbamates.

II Synthesis of iodinated carbamates

Substituted carbamates (1.0 equiv), I-OMe or I-OTs (1.1-2.0 equiv), Pd(OAc)$_2$ (0.05 equiv) were dissolved in commercial dichloroethane in a 15 mL sealed tube. Following that, TfOH (0.5-3.0 equiv) was added into the reaction solution. Then the reaction mixture was stirred at room temperature for 1.5-18.5 h. The reaction was monitored by TLC. After completion of the reaction, saturated NaHCO$_3$ was added to quench the reaction. The reaction mixture was diluted with dichloromethane and washed once with saturated aqueous NaHCO$_3$. Then organic layer was dried over anhydrous Na$_2$SO$_4$ and concentrated on rotavapor under reduced pressure. Finally the residue was purified by silical gel column chromatography to give corresponding iodinated products.

III Synthesis of 1-Methoxy-1,2-benziodoxol-3-(1H)-one$^{[2,3]}$

\[ \begin{array}{c} \text{O} \\ \text{OH} \end{array} \quad \text{NaIO}_4 \text{aq AcOH 30%} \quad 110°C \quad 4.0 \text{h} \quad \begin{array}{c} \text{O} \\ \text{OH} \end{array} \]

Step 1: Following the literature’s method, in a 100mL round-bottom flask, 2-iodobenzoic acid (5 g, 20 mmol) and NaIO$_4$ (4.53 g, 21 mmol, as oxidant) were
added into 30% HOAc/H2O solution (30 mL). Then the reaction was heated up to 110 °C and stirred for 4 h under reflux. After that, the flask was cooled down to room temperature and ice water (ca. 50 mL) was purged into the bottle. The mixture was kept stirring until the crystal precipitated (about 10 min). The crystals were filtered, washed with ice water, and dried in vacuo.

Step 2: In a 100 mL round-bottom flask, 1-hydroxy-1,2-benziodoxol-3-(1H)-one was subjected into Ac2O (14 mL) and the system was quickly heated up to 135 °C until the solid is completely dissolved. Then, the flask was cooled down to room temperature and put into a refrigerator under -20 °C until the crystals precipitated from the solution. Subsequently, the solid was filtered and washed with water for 3 times. Finally, the product was dried in vacuo to afford a white solid. After heating the above-obtained solid in MeOH (35 mL) to reflux for 15 min until a clear, colorless solution was obtained and cooling to ambient temperature followed by crystallization at -20 °C, filtration, washing with a minimal amount of MeOH, and drying under vacuum, the desired product was obtained as white crystals.

1H NMR (300 MHz, CDCl3): δ (ppm) 4.26 (s, 3H), 7.64 – 7.76 (m, 2H), 7.88 (t, J = 7.7 Hz, 1H), 8.24 (d, J = 7.7 Hz, 1H)

IV Synthesis of 1-(p-Toluenesulfonyloxy)-1,2-benziodoxol-3(1H)-one[4]

To a stirred mixture of 2-iodosylbenzoic acid (3.17 g, 12 mmol) in acetic anhydride (6 mL), TsOH • H2O (4.56 g, 24 mmol) was added at room temperature. After 5 min stirring a slightly exothermic reaction began, and the mixture turned into a clear solution. The solution was additionally stirred for 30 min until a white microcrystalline precipitate formed. Then the reaction mixture was diluted with dry ether (20 mL), the precipitate was filtered, washed with anhydrous ether (3x20 mL), and dried in vacuo to afford analytically pure product yield 3.90 g (79%).

1H NMR (CDCl3/CF3COOH, 20:1): δ (ppm) 8.30 (d, 1H, J = 8 Hz), 8.09 (t, 1H, J = 8 Hz), 7.94 (d, 1H, J = 8 Hz), 7.80 (t, 1H, J = 8 Hz), 7.71 (d, 2H, J = 8 Hz), 2.40 (s, 3H).

V Mechanism studies

In NMR tube, I(III)-OMe(0.055 mmol, 15 mg) was dissolved in CDCl3 (0.4 mL), then TfOH(0.1 mmol, 9 μL) was added. After 1.0 h, the reaction mixture directly monitored by 1H NMR.
Then 1 uL of MeOH was added to confirm the peak of methanol.

In NMR tube, 2-fluorophenyl dimethylcarbamate (0.05 mmol, 9 mg), I-OMe (1.1 equiv, 15 mg) and Pd(OAc)$_2$ (0.05 equiv, 0.6 mg) were dissolved in CDCl$_3$. Following that, TfOH (2.0 equiv, 9 uL) was added into the reaction solution. The reaction mixtures was monitored by $^1$H NMR at different time points.
VI Intermolecular Competition Experiments

To two separated sealed tubes, following the general procedure I, o-tolyl dimethylcarbamate (36 mg, 0.20 mmol) or 2-chlorophenyl dimethylcarbamate (40 mg, 0.20 mmol), Pd(OAc)$_2$ (2.3 mg, 0.01 mmol), I-OMe (61 mg, 0.22 mmol), TFOH (1.0 equiv, 18 uL) and DCE:TFEA = 0.6:0.4 ml was added. The mixture was stirred at room temperature. After 10 min, two reactions were quenched and added 4-nitrobenzaldehyde as internal standard. Then, the mixture was washed once with saturated aqueous NaHCO$_3$ and extracted with dichloromethane and concentrated on rotavapor under reduced pressure. The conversion ratio was determined by crude $^1$H-NMR. The ratio of (4) to (6) was 10.3.

VII Procedure for preliminary mechanistic study

1. Preparation of 2-deuterio phenyl dimethylcarbamate$^{[5,6,7]}$.

In an oven-dried 100-mL round-bottomed flask, a solution of 2-bromophenol (1g, 5.78 mmol) and Et$_2$O (15 mL) were cooled to 0 °C. After 5 min, t-BuLi (1.6 M, 8 mL, 12.7 mmol) was added dropwise over 10 min. The mixture was stirred for 3.5 h at 0 °C. Then, D$_2$O (500 mg, 24.9 mmol) was added via syringe. The mixture was then warmed to room temperature slowly overnight. The cloudy, white mixture was diluted
with H₂O (20 mL). The layers were separated. The organic layer was washed with H₂O (20 mL x 3), dried (Na₂SO₄), filtered and concentrated.

Following the general procedure I, the above compounds without further purification (5.78 mmol, 1.0 equiv), K₂CO₃ (1.2 g, 8.68 mmol), dimethylcarbamoyl chloride (6.4 mL, 6.94 mmol) and MeCN (15 mL) was added. The reaction mixture was refluxed for 4h. After completion of the reaction, the residue was purified by silical gel column chromatography (Petroleum ether: Ethyl acetate = 10:1). Finally, desired product (670 mg) was isolated in 70% yield.

1H NMR (400 MHz, CDCl₃) δ (ppm) 7.37-7.34 (m, 2H), 7.19 (t, J = 7.40 Hz, 1H), 7.11 (d, J = 8.40 Hz, 1H), 3.10 (s, 3H), 3.01 (s, 3H); 13C NMR (100 MHz, CDCl₃) δ (ppm) 155.0, 151.6, 129.3, 129.2, 125.2, 121.8, 121.6 (JᵥCᵥ= 24.5 Hz), 36.8, 36.5; LRMS (ESI) calcd for C₉H₁₁DN₂O₂ [M+H]+: 167.09, found 167.12

Then the mixture was quenched, washed once with satu.,rated aqueous NaHCO₃, extracted by dichloromethane and concentrated on rotavapor under reduced pressure. The conversion ratio was determined by crude ¹H-NMR. ¹H-NMR showed k₉/k₉D = 1.0.

When the deprotection was finished, the mixture was acidified by conc. HCl, washed by water and extracted by dichloromethane. Then organic layer was dried over anhydrous Na₂SO₄ and concentrated on rotavapor under reduced pressure. Finally the residue was purified by silical gel column chromatography to give corresponding deprotected products. The yield was 50%.
