1. General Experimental Details

All reactions were carried out under an argon atmosphere in oven-dried glassware with magnetic stirring unless otherwise stated. All chemicals were purchased from commercial suppliers and used without further purification. Anhydrous acetonitrile was obtained by distillation of HPLC grade acetonitrile over calcium hydride. Anhydrous THF was obtained by distillation of HPLC grade THF over sodium metal, with a benzophenone indicator. Screening of conditions were undertaken on a Radley’s Carousel, using Radley’s reaction tubes. Monitoring of reactions was achieved using any of TLC, 1H NMR and GC. GC data was obtained by removing 0.01 mL samples from the reaction mixture and diluting into 1 mL acetonitrile. GC experiments were run on a Hewlett Packard 5890 Series II Gas Chromatograph fitted with a Hewlett Packard 6890 series injector, using a FactorFour™ capillary column VF-5 ms, 30 m, 0.25 mm, 0.25 μm. The experiment conditions were an initial temperature of 30 °C, held for 5 minutes, followed by a gradient of 20 °C/ minute to 150 °C, with a hold time of 11 minutes. Where a reference was used, naphthalene or 1,3,5-trimethoxybenzene were used as a reference for conversion calculations. Celite/silica filtration used Celite® S and technical grade silica gel: pore size 60 Å, 230-400 mesh particle size, 40-63 μm particle size. The term ‘evaporated’ refers to the removal of solvent in vacuo. TLC was performed using silica plates. The silica plates were polyester-backed silica TLC plates with 0.2 mm silica gel and fluorescent indicator. Spots were visualised using an ultraviolet (UV) lamp and KMnO₄ dip. Unless stated otherwise, the term ‘column chromatography’ refers to silica gel flash chromatography. Silica gel chromatography used technical grade silica gel: pore size 60 Å, 230-400 mesh particle size, 40-63 μm particle size. Where silver nitrate-impregnated silica gel was used, this was prepared according to Li and coworkers.¹ ¹HMR experiments were carried out on either a Bruker Avance-400 or a Varian VNMRS-700 spectrometer in deuterated chloroform (CDCl₃). Chemical shifts are reported in ppm relative to tetramethylsilane (TMS) reference. Experiments undertaken included ¹H, ¹¹B, ¹⁹F, ¹³C, COSY, PSYCHE, HSQC and HMBC NMR. Electrospray ionisation (ESI) mass spectroscopy was undertaken using a LTQ FT (ThermoFinnigan) high resolution, accurate mass LC ES MS/MS or a Thermo Scientific LTQ Orbitrap XL. Samples were made up as 1 mg per mL solutions in acetonitrile. GC/MS EI was undertaken using a Waters GCT Premier. Atmospheric solids analysis probe (ASAP) mass spectroscopy was undertaken using LCT Premier XE (Waters) high resolution, accurate mass ultra performance liquid chromatography (UPLC) ASAP or a Thermo Scientific LTQ Orbitrap XL. Samples were either made up as 1 mg per mL solutions in acetonitrile or run as solids. Infra-red (IR) spectroscopy were undertaken using either a Perkin Elmer-1600 FTIR or UATR Two FTIR spectrometers, using both liquid and solid samples. Melting point measurements were undertaken using a Gallenkamp melting point apparatus. Where products were susceptible to polymerisation, these were stored with approximately 20 ppm BHT under argon at either 4 °C or -18 °C.

Pd(OAc)$_2$ (0.0650 mmol) monodentate ligand (0.130 mmol) or bidentate ligand (0.0650 mmol) and base (0.780 mmol) were added to reaction tubes under argon. MeCN (4.5 mL), previously degassed by the freeze-pump-thaw method (4x cycles) was added to each tube together with vinyl iodide 17 (0.650 mmol) and vinyl boronate 15 (0.780 mmol). The reaction tubes were then evacuated and filled with argon, and the reaction tubes stirred at 50 °C for 3 days. An internal reference compound of naphthalene (0.0650 mmol) was used. Reaction products and conversions were identified by $^1$H NMR.

To a completely cooled, oven dried round bottom flask was added (E)-2-(buta-1,3-dienyl)-4,4,6-trimethyl-1,3,2-dioxaborinane (183 mg, 1.01 mmol), followed by BHT (20 ppm, 0.014 mL of a 1x10$^{-3}$ M solution in THF), 1,3,5-trimethoxybenzene (0.675 mL of a 1 M solution in THF, 0.675 mmol), aryl or vinyl halide (0.675 mmol), t-BuOK (91.0 mg, 0.810 mmol) and Pd(PPh$_3$)$_4$ (39.0 mg, 0.0338 mmol). After purging with Ar for 2 minutes, degassed THF (6 mL) under Ar and the reaction mixture further degassed by sparging with Ar for 2 minutes. The reaction mixture was heated to 60 °C.
