1. General

All the palladium-catalyzed reactions were performed under nitrogen atmosphere in a flame-dried reaction tube. All solvents were distilled under nitrogen atmosphere prior to use. Toluene, dioxane and THF were dried over Na with benzophenone-ketyl intermediate as indicator. MeCN, MeOH were dried over CaH₂. For chromatography, 200-300 mesh silica gel (Qingdao, China) was employed. ¹H and ¹³C NMR spectra were recorded at 400 MHz and 100 MHz with Brucker ARX 400 spectrometer. Chemical shifts are reported in ppm using tetramethylsilane as internal standard when using CDCl₃ as solvent. IR spectra were recorded with a Thermo Electron Corporation Nicolet AVATAR 330 FT-IR spectrometer. MS data were obtained on an Agilent 5975C inert 350 EI mass spectrometer (GC-MS). HRMS data were obtained on a VG ZAB-HS mass spectrometer, Brucker Apex IV FTMS spectrometer. PE = petroleum ether, EA = ethyl acetate.

2. General procedure for the preparation of the ene-yne-ketones

The conjugated enynones 1a-m were synthesized by the procedure described in our recent report.¹ A typical procedure for the synthesis of enynone 1c is as follows:

1-Heptyne (10 mmol) was dissolved in dry THF (15 mL) and the solution was cooled to -40 °C under nitrogen, n-butyllithium (1.6 M in hexanes, 6.8 mL, 11 mmol) was added dropwise over ca. 2 minutes while maintaining the temperature between -35 and -40 °C. After completion of the addition, anhydrous DMF (1.55 mL, 20mmol) was added in one portion and the cold bath was removed. The reaction mixture was allowed to warm to room temperature and aged for 30 minutes. The THF solution was poured into a vigorously stirred biphasic solution prepared from aqueous solution of KH₂PO₄ (50 mL, 30 mmol) and Et₂O (30 mL) cooled over ice to ca. +5 °C. Layers were separated and the organic extract was washed with water (2 x 30 mL). Combined aqueous layers were back extracted with Et₂O (30 mL). Combined organic layers were dried over Na₂SO₄ and filtered. Then solvent was removed in vacuo carefully under 0 °C to leave a crude acetylenicaldehyde.²
The crude aldehyde was then dissolved in THF (8 mL), and 1,3-dicarbonyl compound, acetoacetone, (10 mmol) was added into the solution. Then AcOH (2 mmol) and MgSO$_4$ (2 mmol) was added to the reaction mixture. The mixture was stirred at room temperature for about one hour. When the reaction was completed as monitored by TLC, filtration through Celite and removal of the solvent by rotary evaporation gave the crude product. The enynone 1c was purified by chromatography on silica gel with the appropriate mixture of PE and EA (PE:EA=50:1) with about 70% yield (two steps). The unsymmetric 1,3-dicarbonyl compounds would afford enynones (1a, b, d, e, g, i, j, l) as a mixture of E- and Z-isomer (about 1:1) (Scheme S1). The enynones need to be kept in refrigerator below 0 °C.\(^1\)

The spectral data for enyne 1c: \(^\text{1}^\text{H} NMR (400 MHz, CDCl$_3$) \delta 6.70 (t, J = 2.4 Hz, 1H), 2.47 (s, 3H), 2.44 (dt, J = 2.4, 7.1 Hz, 2H), 2.32 (s, 3H), 1.61-1.53 (m, 2H), 1.41-1.30 (m, 4H), 0.91 (t, J = 7.1 Hz, 3H); \(^\text{13}^\text{C} NMR (100 MHz, CDCl$_3$) \delta 201.31, 195.76, 149.47, 123.24, 110.51, 76.83, 30.98, 30.91, 27.73, 27.19, 22.07, 20.15, 13.87.

Scheme S1. The structure of enynones used in this work.
3. General procedure for Pd-catalyzed alkyne-alkyne cross-coupling

Under an nitrogen atmosphere, Pd(OAc)$_2$ (2.2 mg, 0.01 mmol, 5 mol%), P(2-furyl)$_3$ (7.0 mg, 0.03 mmol, 15 mol%), and 1,4-benzoquinone (26 mg, 0.24 mmol) were successively added to a flame-dried 10 mL Schlenk tube. The reaction flask was degassed three times with nitrogen and dry dioxane (2.0 mL) was added using a syringe. Then iPr$_2$NH (0.60 mmol, 61 mg), terminal alkynes (2, 0.22 mmol) and enynone (1, 0.20 mmol) was added by syringe successively. Note that the terminal alkyne in a solid form was added to the reaction tube before the solvent. The reaction was heated at 90 °C with stirring for 1 h, then cooled to room temperature and filtered through a short plug of silica gel (PE:EA=5:1, 15 mL) as eluents. Solvent was then removed in vacuo to leave a crude mixture, which was purified by silica gel column chromatography to afford pure product conjugated enynes 3 or 4. (*Notice: The conjugated enynes are unstable even stored in nitrogen atmosphere in refrigerator at -40 °C, thus the measurement of the data for these products should be conducted as soon as possible when they were isolated.*)

4. Characterization data for the products

7. Control experiment

Under an nitrogen atmosphere, Pd(OAc)$_2$ (2.2 mg, 0.01 mmol, 5 mol%), P(2-furyl)$_3$ (7.0 mg, 0.03 mmol, 15 mol%), and 1,4-benzoquinone (26 mg, 0.24 mmol) were successively added to a flame-dried 10 mL Schlenk tube. The reaction flask was degassed three times with nitrogen and dry dioxane (2.0 mL) was added using a syringe. Then iPr$_2$NH (0.60 mmol, 61 mg), terminal alkynes (2a, 0.22 mmol) and enynone (1d, E/Z = 1.5:1, 0.20 mmol) was added by syringe successively. The reaction was heated at 90 °C with stirring for 5 min or 10 min, then cooled to room temperature and filtered through a short plug of silica gel (PE:EA=5:1, 15 mL) as eluents. Solvent was then removed in vacuo to leave a crude mixture, which was analyzed by $^1$H NMR [by adding mesitylene (0.1 mmol) as the internal standard].

</tbody>
</table>

Based on these results, it was obvious that the ratio of the E/Z isomers remained unchanged during the conversion of the starting material to the product. According to the proposed mechanism and our previous report (ref. 6), only E-isomer can undergo cyclization to form furyl Pd-carbene species. The Z-isomer should be first isomerized to the E-isomer for undergoing further reaction with the terminal alkynes. Thus we can conclude that E/Z isomers undergo fast isomerization under the reaction conditions.

This conclusion is also in accordance with the previous work that cyclization to form furyl Pd-carbene species is a rate-limiting step (energy barrier = 22-26 kcal/mol, ref. 6) and thus needs a reaction temperature about 90 °C, while the isomerization of the ene-yne-ketones can even occur in room temperature over an extended period of time (ref. 5k).
