General methods

Dichloromethane (CH$_2$Cl$_2$) was distilled from CaH$_2$ and stored over molecular sieves (3 Å). La[N(SiMe$_3$)$_2$]$_3$ ≥98% (99.9%-La) was purchased from Strem Chemicals Inc. and stored in a glove box. All other solvents and reagents were used as purchased without further purifications. Silica column chromatography was performed with chromatographic silica media for separation and purification applications (35-70 micron). $^1$H NMR and $^{13}$C NMR were recorded with Varian 400, Varian 500 or Bruker 800. $^{19}$F NMR was recorded with Varian 500. The chemical shifts are reported in ppm relative to the residual peak from the solvent CDCl$_3$ ($^1$H NMR δ 7.26, $^{13}$C NMR δ 77.16) or CD$_2$Cl$_2$ ($^1$H NMR δ 5.32). For $^{19}$F NMR, the peaks are reported in ppm, using hexafluorobenzene in CDCl$_3$ as internal reference ($^{19}$F NMR δ −162.2). The conversion of the substitution reactions were measured by GC-FID with n-dodecane as internal standard, standardized by calibrating against authentic samples of pure starting material, or analyzed by $^1$H and $^{19}$F NMR. GC-FID was performed on a GC Varian 3900 with an auto sampler equipped with an EQUITYTM-5 column (30 m * 0.25 mm * 0.25 µm), and with hydrogen as carrier gas. GC-FID method: 80 °C, 2 min; 20 °C-min$^{-1}$ to 300 °C, 2 min; injector temperature 300 °C, Rt (n-dodecane) = 5.6 min.

[a] The corresponding Lewis acids gave <10% yield due to work-up (see Entry 14). Prolonged reaction times resulted in the same outcome and only <10% yield was obtained. Thus, showing no effect of the corresponding Lewis acid in the C-F bond activation.

General method for C-F bond substitution

The reaction was run under dry and inert conditions. To La[N(SiMe$_3$)$_2$]$_3$ (124 mg, 0.20 mmol, stored and weighed in the glove box) was added CH$_2$Cl$_2$ (1.25 mL) followed by the substrate (200 µL, 0.20 mmol, 1.0 M in CH$_2$Cl$_2$) and the nucleophile [dibutylamine (37 µL, 0.22 mmol)]. The reaction was stirred at room temperature to completion after which it was quenched by adding it directly to silica gel column and purified by flash column chromatography.

To $\text{La}[\text{N(SiMe}_3\text{)}_2]_3$ (50 mg, 0.08 mmol), in a NMR tube, was added $\text{CD}_2\text{Cl}_2$ (0.5 mL) followed by anti-$1l$ (80 μL, 0.08 mmol, 1.0 M in $\text{CD}_2\text{Cl}_2$ A). $^1$H NMR spectra was recorded. After aziridinium ion formation has been completed (B), $N$-benzyl methyl amine (10 μL, 0.08 mmol) was added and $^1$H NMR spectra was recorded to follow the ring opening of the aziridinium ion (C). The anti-$2t$ product that was obtained was in agreement with that previously reported.\(^{22}\)
