General
Chemicals and solvents required were obtained from commercial suppliers. $^1$H, $^{13}$C, and 2D NMR spectra were recorded on a JEOL JNM-ECA600 spectrometer. Mass spectra were measured on JMS-T100LC AccTOF (JEOL) or solariX FT-ICR-MS spectrometer (Bruker Daltonik GmbH) spectrometers.

Computational methods

The Gaussian 09 program\textsuperscript{1} was used for the \textit{ab initio} molecular orbital calculations. The basis set implemented in the program was used for the calculations. The geometries of monomer and dimer were optimized at the HF/6-311G** level. The intermolecular interaction energy ($E_{\text{int}}$) was calculated by supermolecular method at the MP2/6-311G** level. The basis set superposition error (BSSE)$^2$ was corrected by the counterpoise method$^3$ in the interaction energy calculations. Electron correlation was accounted for by the second-order Møller-Plesset perturbation (MP2) method. The stabilization energy by the formation of the dimer from monomers ($E_{\text{form}}$) was calculated according to equation (1),

$$E_{\text{form}} = E_{\text{int}} + E_{\text{def}} \quad (1)$$

where the $E_{\text{def}}$ denotes the sum of the increases of energies of the monomers by the deformation of molecular geometries associated with the dimer formation. The $E_{\text{def}}$ was calculated at the MP2/6-311G** level.
