1. General details

**General information:** Unless otherwise noted, all reagents were used as received from commercial suppliers. Silver and gold catalysts were obtained from Sigma-Aldrich and used without further purification. All reactions were performed under nitrogen atmosphere and in a flame-dried or oven-dried glassware with magnetic stirring. Dichloroethane (DCE) was dried in the presence of calcium chloride and distilled prior to use. Reactions were monitored using thin-layer chromatography (SiO$_2$). TLC plates were visualized with UV light (254 nm), iodine treatment or using $p$-anisaldehyde stain. Column chromatography was carried out using silica gel (60-120 mesh & 100-200 mesh) packed in glass columns. NMR spectra were recorded at 300, 400, 500 MHz (H) and at 75, 101, 126 MHz (C), respectively. Chemical shifts ($\delta$) are reported in ppm, using the residual solvent peak in CDCl$_3$ (H: $\delta = 7.26$ and C: $\delta = 77.0$ ppm) as internal standard, and coupling constants ($J$) are given in Hz. HRMS were recorded using ESI-TOF techniques.

**General procedure:**

**Step 1:**

To a vigorously stirred suspension of 2-methyl-1,3-cyclopentanedione (1 equiv) in water (1 M) was gradually added powdered NaHCO$_3$ (1 equiv). After the frothing had settled, propargyl bromide (2 equiv.) was added and the reaction mixture was stirred at 80 °C for 16 hr. Later, The reaction mixture was extracted with CH$_2$Cl$_2$ (2 times) and the combined organic solvent was washed with 5% aqueous NaHCO$_3$, dried (Na$_2$SO$_4$), filtered, and concentrated in vacuo to give pale yellow solid. Recrystallization of crude material in ether-pentane gave of pure compound S1 in 85% yield.
Step 2:
To a solution of 2-methyl-2-propargyl-1,3-cyclopentanedione (S1)\(^1\) (10.0 mmol) in anhydrous DMSO (0.5 M, 20 mL) was added Pd(PPh\(_3\))\(_2\)Cl\(_2\) (0.2 mmol), CuI (0.5 mmol), Et\(_3\)N (17 mmol) and arylbromide (11 mmol). The combined organic solvent was washed with 10% aqueous HCl (3 × 20 mL), dried (Na\(_2\)SO\(_4\)), filtered, and concentrated in vacuo. The mixture was purified by column chromatography (EtOAc/hexane) to give alkynone 1. Compounds 1a-d, 1g, 3a were prepared according to a previously reported procedure.\(^2\)

Data collection and Structure solution: X-ray data for compound 2a were collected at room temperature using the Bruker Smart Apex CCD diffractometer with graphite monochromated MoKα radiation (λ=0.71073Å) with ω-scan method. Preliminary lattice parameters and orientation matrices were obtained from four sets of frames. Unit cell dimensions were determined using 7257 reflections. Integration and scaling of intensity data were accomplished using SAINT program. The structures were solved by Direct Methods using SHELXS97 and refinement was carried out by full-matrix least-squares technique using SHELXL-2014/7. Anisotropic displacement parameters were included for all non-hydrogen atoms. All H atoms were positioned geometrically and treated as riding on their parent C atoms, with C-H distances of 0.93--0.97 Å, and with $U_{iso}(H) = 1.2U_{eq}(C)$ or $1.5U_{eq}$ for methyl atoms.
