1. Synthetic details
1.1 Materials and methods

All reagents were purchased from Fisher, Sigma, Alfa Aesar and Fluorochem, and used without further purification. THF was dried over CaH$_2$ and then Na-benzophenone distillations. NH-NiTPP, 2-bromo-3-hexyl-5-iodothiophene and P3HT (7600 g mol$^{-1}$; D=1.23) were synthesized according to the previous reported procedures $^{1-3}$.

$^1$H and $^{13}$C($^1$H) NMR spectra were recorded either on a Bruker Avance-300 spectrometer for each monomer synthetic intermediates and on a Bruker Avance-600 spectrometer for the diblock copolymers with tetramethylsilane as internal standard. Chemical shifts are reported in delta (δ) units, expressed in parts per million (ppm) and coupling constants (J) are expressed in Hertz.

Molecular weights of the copolymers were determined by using a size exclusion chromatography (SEC) on a Polymer Laboratories liquid chromatograph equipped with a PL-DG802 degasser, an isocratic HPLC pump LC 1120 (flow rate = 1 mL min$^{-1}$), a Marathon autosampler (loop volume = 200 mL, solution conc. = 1 mg mL$^{-1}$), a PL-DRI refractive index detector and three columns: a PL gel 10 mm guard column and two PL gel Mixed-B 10 mm columns (linear columns for separation of MWPS ranging from 500 to 10$^6$ Daltons). The eluent used was THF at a flow rate of 1 mL min$^{-1}$ at 35 °C. Polystyrene standards were used to calibrate the SEC.

UV-visible spectra were obtained on a Shimadzu UV2401 PC UV/Vis scanning spectrometer. End-functionalized P3HT 2, P3HT and porphyrin 1 thin films were prepared by drop-casting from xylene solutions (1 mg mL$^{-1}$) on pre-cleaned quartz substrates. Hydrodynamic diameters of the nanoparticles were determined by dynamic light scattering using a Cordouan Particle Size Analyzer VASCO. The temperature of the dispersion was set at 25°C. For CHCl$_3$–MeOH Mixture (1:1), the refractive index was calculated using the following equation:

$$\frac{n_{12}^2 - 1}{n_{12}^2 + 2} = f_1 \frac{n_1^2 - 1}{n_1^2 + 2} + f_2 \frac{n_2^2 - 1}{n_2^2 + 2}$$

in which $n_1$, $n_2$ and $n_{12}$ are the refractive indices of solvent 1, solvent 2 and the mixture respectively and $f_1$ and $f_2$ are their volume fractions.

Viscosities of CHCl$_3$/MeOH mixtures were calculated according to the Arrhenius equation:

$$\log \eta_{12} = x_1 \log \eta_1 + x_2 \log \eta_2$$

in which $\eta_1$, $\eta_2$ and $\eta_{12}$ are the viscosities of solvent 1, solvent 2 and the mixture respectively and $x_1$ and $x_2$ their mole fractions.

Autocorrelation curves were recorded during 60 seconds. The Pade–Laplace algorithm implemented on the software provided by Cordouan was used to derive the hydrodynamic diameter. 60 measurements were performed.

Thermogravimetric analysis (TGA) was conducted on a TA Instrument Q500. Samples were first held at a constant temperature, and then, heated to 800 °C at a rate of 20 °C min$^{-1}$ under an inert atmosphere (nitrogen). Differential Scanning Calorimetry (DSC) characterization was performed using a DSC Instrument Q200 under an atmosphere of nitrogen at a heating/cooling rate of 10 °C min$^{-1}$. All DSC analyses were performed using an aluminum pan with a sample of approximately 5-10 mg. Powder XRD analyses were carried out on a Philips X’pert Pro MPD diffractometer using Cu Ka1 radiation ($\lambda = 1.5406$ Å) in Bragg-Brentano scanning mode with a 2θ angle ranging from 4 to 40° (or 4 to 53°), and a time per step of 50 or 300 s, depending on the sample. The AFM measurements were performed on an
Icon Bruker microscope in tapping mode. Samples for atomic force microscopy (AFM) measurements were prepared by drop casting xylene solutions (0.1 mg mL⁻¹) of the polymer onto mica substrates, and then placed under saturation with xylene vapor for 16 h.

1.2 Synthesis of isocyanide porphyrin monomer (I)

**Scheme S1** Synthesis of isocyanide porphyrin monomer I.

1-((6-iodohexyl)oxy)-4-nitrobenzene. 1,6-diiodohexane (27.9 g, 82.5 mmol), 4-nitrophenol (2.30 g, 16.5 mmol), potassium carbonate (4.6 g, 33 mmol) and 18-crown-6 (436 mg, 1.65 mmol) were dissolved in acetone (100 mL). The reaction mixture was stirred under reflux for 2 days. After cooling, the resulting solution was concentrated by evaporation and water (450 mL) was added. The aqueous layer was extracted with CH₂Cl₂ (3 x 100 mL). The combined extracts were washed with a solution of hydrochloric acid 1N (40 mL) and several times with water until pH=7. The organic layer was dried over MgSO₄, filtered, evaporated under reduced pressure and purified by column chromatography on silica gel eluting with a gradient of pentane – dichloromethane (100:0 to 50:50) to give the *title compound* as a colorless solid (5.5 g, 95%). ¹H NMR (300 MHz, CDCl₃): δ 8.20 (d, 2H, J_H-H = 9.2 Hz, NO₂-ArH), 6.94 (d, 2H, J_H-H = 9.2 Hz, O-ArH), 4.05 (t, 2H, J_H-H = 6.4 Hz, OCH₂), 3.21 (t, 2H, J_H-H = 6.9 Hz, ICH₂), 1.99 – 1.70 (m, 4H, CH₂), 1.64 – 1.39 (m, 4H, CH₂) ppm. ¹³C{¹H} NMR (75 MHz, CDCl₃): δ 164.2 (NO₂-C₂), 141.5 (O-C₂), 126.0 (CH), 114.5 (CH), 68.7 (OCH₂), 33.4 (CH₂), 30.2 (CH₂), 28.9 (CH₂), 25.0 (CH₂), 7.0 (ICH₂) ppm. HRMS (ESI): m/z = [M+H]⁺ Calcd for C₁₂H₁₇NO₃: 350.0253. Found: 350.0247.

NO₂-Spacer-NiTTP. A solution of NH-NiTTP (100 mg, 0.146 mmol) and sodium hydride 60 % (30 mg, 0.73 mmol) in THF (10 mL) was stirred for 15 minutes at room temperature under argon. 1-((6-iodohexyl)-4-nitrobenzene (56 mg, 0.16 mmol) was then added to the resulting solution and the mixture was stirred under reflux overnight. The N-alkylation was followed by TLC. When finished, the solvent was evaporated under reduced pressure and the residue was diluted with dichloromethane. The organic layer was washed several times with
water to pH=7, dried over MgSO₄, filtered, evaporated and purified by column chromatography on silica gel eluting with cyclohexane – ethyl acetate (90:10) to give the *title compound* as a purple solid (75 mg, 57 %). ¹H NMR (300 MHz, CD₂Cl₂): δ 9.38 (d, 1H, J_H-H = 4.8 Hz, pyrrole), 8.96 (dd, 1H, J_H-H = 8.1 and 1.6 Hz, ArH), 8.80 (d, 1H, J_H-H = 4.7 Hz, pyrrole), 8.65-8.49 (m, 4H, pyrrole and ArH-NO₂), 8.13-7.93 (m, 10H, pyrrole and ArH), 7.86-7.59 (m, 11H, ArH), 6.94 (d, 2H, J_H-H = 9.3 Hz, Ar-OCH₂), 4.94 (t, 2H, J_H-H = 7.5 Hz, OCH₂), 3.99 (t, 2H, J_H-H = 6.8 Hz, NCH₂), 2.31 (m, 2H, CH₂), 1.91-1.58 (m, 6H, CH₂) ppm. ¹³C{¹H} NMR (75 MHz, CD₂Cl₂): δ 164.7 (C_q-NO₂), 143.9 (C_q), 143.8 (C_q), 142.6 (C_q), 141.8 (C_q), 141.4 (C_q), 140.5 (C_q), 138.6 (C_q), 137.5 (C_q), 136.1 (C_q), 135.9 (CH), 134.3 (C_q), 134.3 (CH), 134.1 (CH), 134.0 (CH), 133.7 (C_q), 133.1 (CH), 132.7 (CH), 132.6 (CH), 132.4 (CH), 130.7 (CH), 130.7 (CH), 128.3 (C_q), 128.0 (CH), 128.0 (CH), 127.5 (CH), 127.5 (CH), 126.3 (CH), 122.6 (CH), 121.3 (CH), 116.0 (C_q), 114.9 (CH), 113.9 (CH), 113.3 (CH), 69.3 (OCH₂), 49.2 (NCH₂), 29.4 (CH₂), 27.7 (CH₂), 27.5 (CH₂), 26.5 (CH₂) ppm. HRMS (ESI): m/z = [M+H]+ Calcd for C₅₆H₃₃N₆O₃Ni : 905.2750. Found: 905.2751. UV-visible (CHCl₃): λ nm (ε M⁻¹cm⁻¹) = 423 (74000), 448 (65500), 556 (6300), 602 (10400), 636 (18200).

**NHCO-Spacer-NiTPPP.** To a degassed solution of 5 (66 mg, 0.073 mmol) in CH₂Cl₂ (66 mL) and methanol (7.3 mL) was added 10 % Pd/C (3 mg, 0.03 mmol) and then, sodium borohydride (66 mg, 1.7 mmol). The mixture was stirred for 1 hour at room temperature under argon. The reaction was followed by TLC. When finished, the solvent was evaporated under reduced pressure and the residue was diluted with dichloromethane. The organic layer was filtered to eliminate salts and evaporated. To a degassed solution of the residue in toluene (5 mL) was added formic acid (5 mL). The mixture was stirred under reflux overnight. The reaction was followed by TLC. When finished, the solvent was evaporated under reduced pressure and the residue was diluted with dichloromethane. The organic layer was washed with aqueous saturated NaHCO₃ and water to pH=7, dried over MgSO₄, filtered, evaporated and purified by column chromatography on silica gel eluting with dichloromethane to give the *title compound* as a purple solid (56 mg, 87 % in 2 steps). ¹H NMR(300 MHz, CD₂Cl₂): δ 9.34 (dd, 1H, J_H-H = 4.8 Hz and 1.2 Hz, pyrrole), 8.91 (dd, 1H, J_H-H = 8.0 and 1.7 Hz, ArH), 8.78 (dd, 1H, J_H-H = 4.8 Hz and 1.3 Hz, pyrrole), 8.64-8.54 (m, 4H, pyrrole), 8.37 (d, 0.3H, J_H-H = 11.5 Hz, amide), 8.16 (d, 0.7H, J_H-H = 1.8 Hz, amide), 8.08-7.92 (m, 7H, ArH), 7.92 (dd, 1H, J_H-H = 8.6 Hz and 1.3 Hz, ArH), 7.74-7.61 (m, 11H, ArH), 7.26 (d, 1.3 H, J_H-H = 9 Hz, NHCHO-ArH), 6.93 (broad s, 1H, NH), 6.97 (d, 0.7 H, J_H-H = 8.9 Hz, NHCHO-ArH), 6.73 (d, 2H, J_H-H = 9 Hz, ArH-O), 4.75 (t, 2H, J_H-H = 7.7 Hz, OCH₂), 3.83 (t, 2H, J_H-H = 6.3 Hz, NCH₂), 2.20 (m, 2H, CH₂), 1.90-1.56 (m, 6H, CH₂) ppm. ¹³C{¹H} NMR (75 MHz, CD₂Cl₂): δ 162.8 (NHCHO), 159.0 (C_q), 145.1 (C_q), 143.9 (C_q), 143.8 (C_q), 143.4 (C_q), 142.6 (C_q), 141.8 (C_q), 141.4 (C_q), 141.4 (C_q), 140.5 (C_q), 138.7 (C_q), 138.5 (C_q), 136.0 (C_q), 135.8 (CH), 134.3 (CH), 134.1 (CH), 134.0 (CH), 133.0 (CH), 132.8 (CH), 132.6 (CH), 132.4 (CH), 130.7 (CH), 130.6 (CH), 128.3 (CH), 128.1 (CH), 128.0 (CH), 127.9 (CH), 127.5 (CH), 127.5 (CH), 122.5 (CH), 122.0 (CH), 121.9 (CH), 121.2 (C_q), 116.0 (C_q), 115.8 (CH), 115.2 (C_q), 115.1 (CH), 113.8 (CH), 109.7 (C_q), 98.5 (CH), 68.5 (OCH₂), 49.2 (NCH₂), 29.7 (CH₂), 27.7 (CH₂), 27.5 (CH₂), 26.5 (CH₂) ppm. HRMS (ESI): m/z = [M+H]+ Calcd for C₅₇H₄₅N₆O₂Ni : 903.2957. Found: 903.2959. IR ATR: 3150 (NH), 1690 (C=O) cm⁻¹. UV-visible (CHCl₃): λ nm (ε M⁻¹cm⁻¹) = 427 (78000), 448 (74000), 558 (80000), 602 (12000), 638 (20000).
Synthesis of 1. NHCO-Spacer-NiTPP (50 mg, 0.055 mmol) was dissolved in THF (5 mL) and cooled to 0°C. Triethylamine (39 µL, 0.28 mmol) and POCl₃ (6 µL, 0.06 mmol) were added by micro-seringe to the mixture and stirring was continued at 0°C for 3 hours. A saturated sodium carbonate solution (5 mL) was added at room temperature and the resulting solution was stirred for 1 hour. Then, the aqueous layer was extracted with dichloromethane. The organic layer was washed several times with water and brine to pH=7, dried over MgSO₄, filtered, evaporated and purified by column chromatography on alumina gel eluting with cyclohexane – dichloromethane (50:50) to give the title compound as a purple solid (40 mg, 80 %). ¥H NMR (300 MHz, CDCl₃): δ 9.35 (d, 1H, J_H-H=4.8 Hz, pyrrole), 8.92 (d, 1H, J_H-H =7.6 Hz, ArH), 8.81 (d, 1H, J_H-H = 4.8 Hz, pyrrole), 8.61 (d, 1H, J_H-H = 5.1 Hz, pyrrole), 8.55 (s, 2H, pyrrole), 8.07-7.90 (m, 7H, ArH/pyrrole), 7.82-7.57 (m, 13H, ArH), 7.21 (d, 2H, J=8.9 Hz, O-ArH), 6.76 (d, 2H, J_H-H = 8.9 Hz, CN-ArH), 4.67 (t, 2H, J_H-H = 7.5 Hz), 3.78 (t, 2H, J_H-H = 6.2 Hz), 2.12 (m, 6H, CH₂), 1.73-1.54 (m, 6H, CH₂) ppm. ¥C{1H} NMR (75 MHz, CDCl₃) : δ 159.3 (C_ortho), 144.6 (C_ortho), 143.4 (C_ortho), 143.3 (C_ortho), 143.0 (C_ortho), 142.2 (C_ortho), 141.5 (C_ortho), 141.1 (C_ortho), 141.0 (C_ortho), 140.2 (C_ortho), 138.3 (C_ortho), 138.1 (C_ortho), 135.5 (CH), 135.4 (C_ortho), 133.8 (CH), 133.7 (CH), 133.5 (CH), 132.8 (CH), 132.4 (CH), 132.2 (CH), 130.5 (CH), 130.4 (CH), 129.7 (C_ortho), 127.8 (CH), 127.7 (CH), 127.6 (CH), 127.5 (CH), 127.3 (CH), 127.1 (CH), 127.0 (CH), 122.0 (CH), 120.9 (C_ortho), 120.8 (C_ortho), 115.7 (C_ortho), 115.0 (CH), 114.6 (C_ortho), 113.0 (CH), 109.2 (C_ortho), 98.0 (CH), 68.1 (OCH₂), 48.4 (NCH₂), 29.0 (CH₂), 27.2 (CH₂), 27.1 (CH₂), 26.0 (CH₂) ppm. HRMS (ESI) : m/z = [M+H]⁺ Calcd for C_{27}H_{33}N_{6}NiO: 885.2841. Found: 885.2852. IR ATR: 2118 cm⁻¹ (ν≡C). UV-visible (CHCl₃): λ nm (ε M⁻¹.cm⁻¹) = 423 (48000), 448 (44000), 557 (4300), 601 (7300), 637 (13000).

1.3. General procedure for the synthesis of P3HT end-functionalized with π-extended porphyrins (2)

To a dried round-bottomed flask containing 2-bromo-3-hexyl-5-iodothiophene (X mmol), previously dried by three successive azeotropic distillations with toluene, was added dry THF (C = 0.2 M). iPrMgCl.LiCl (1.3 M in THF, X mmol) was then added via a syringe and the mixture was stirred at 0°C for 30 minutes. To a second dried round-bottomed flask containing the Ni(dpdp)Cl₂ catalyst ((166X+885Y)/M₀) in THF (C = 0.01 M), was added the first solution of 2-bromo-5-chloromagnesio-3-hexylthiophene. The resulting orange mixture was stirred at room temperature under nitrogen and the polymerization was monitored by GPC. After stirring the reaction mixture for 3 hours, the isocyanide porphyrin 1 (Y mmol) was added in one portion and the resulting green solution was stirred overnight. By pouring aq. HCl (5 M) quickly, the polymerization was quenched and then, the mixture was poured into cold MeOH causing a dark precipitate. The solids were filtered off, washed with methanol and dried under vacuum to afford a black solid.

**1-(6-iodohexyloxy)-4-nitrobenzene**

![Fig. S2 $^1$H NMR spectrum of 1-(6-iodohexyloxy)-4-nitrobenzene in CDCl$_3$.](image)
Fig. S3 $^{13}$C($^1$H) NMR spectrum of 1-(6-iodohexyloxy)-4-nitrobenzene in CDCl$_3$.

Fig. S4 DEPT 135 NMR spectrum of 1-(6-iodohexyloxy)-4-nitrobenzene in CDCl$_3$. 
**NO$_2$-Spacer-NiTPP**

Fig. S5 $^1$H NMR spectrum of NO$_2$-Spacer-NiTPP in CD$_2$Cl$_2$.

Fig. S6 $^{13}$C($^1$H) NMR spectrum of NO$_2$-Spacer-NiTPP in CD$_2$Cl$_2$. 
Fig. S7 DEPT NMR spectrum of NO$_2$-Spacer-NiTPP in CD$_2$Cl$_2$.

**NHCO-NiTPP**

Fig. S8 $^1$H NMR spectrum of NHCO-NiTPP in CD$_2$Cl$_2$. 

Fig. S9 $^{13}$C($^1$H) NMR spectrum of NHCO-NiTPP in CD$_2$Cl$_2$. 

Fig. S10 DEPT 135 NMR spectrum of NHCO-NiTPP in CD$_2$Cl$_2$. 
Isocyanide-based porphyrin monomer (1)

Fig. S11 $^1$H NMR spectrum of isocyanide-based porphyrin monomer 1 in CDCl$_3$.

Fig. S12 $^{13}$C{$^1$H} NMR spectrum of isocyanide-based porphyrin monomer 1 in CDCl$_3$. 
Fig. S13 DEPT 135 NMR spectrum of of isocyanide-based porphyrin monomer 1 in CDCl₃.

2.2. *P3HT end-functionalized with π-extended porphyrins (2)*

Fig. S14 ¹H NMR spectrum of 2a in CDCl₃.
Fig. S15 $^{13}$C($^1$H) NMR spectrum of 2a in CDCl$_3$.

Fig. S16 $^1$H NMR spectrum of 2b in CDCl$_3$. 
Fig. S17 $^{13}\text{C}\{^1\text{H}\}$ NMR spectrum of 2b in CDCl$_3$.

Fig. S18 $^1\text{H}$ NMR spectrum of 2c in CDCl$_3$. 
Fig. S19 $^{13}$C{$^1$H} NMR spectrum of 2c in CDCl$_3$. 
3. GPC traces

Fig. S20 Representative GPC chromatograms of homopolymer P3HT (black line) and a representative P3HT end-functionalized with π-extended porphyrin (2, red line) [a) 2a; b) 2b; c) 2c]. (*) oligomer species or impurities coming from the sample preparation.
**4. IR analysis**

**Fig. S21** ATR-IR spectra of isocyanide porphyrin monomer (a) and P3HT end-functionalized with \( \pi \)-extended porphyrins (b) measured at room temperature.
4. Optical properties

Fig. S22 UV-Visible absorption spectra of isocyanide porphyrin monomer 1 in chloroform (green curve), 2a in chloroform (red curve) and 2a in solid state (blue curve).

Fig. S23 UV-Visible absorption spectra of isocyanide porphyrin monomer 1 (green curve), 2a (blue curve) and P3HT (red curve) in solid state.
Fig. S24 UV-Visible absorption spectra of P3HT end-functionalized with π-extended porphyrins in the solid state at different molar ratios of the porphyrin block.

5. Aggregation properties

Fig. S25 Intensity weighted size dispersion of the polymer 2a (C = 0.12 mg.mL$^{-1}$) in CHCl$_3$:MeOH (1:1 v/v ratio) at 25°C.
6. Thermal properties
6.1. TGA

Fig. S26 TGA thermograms of P3HTs end-functionalized with π-extended porphyrins at different molar ratios of the porphyrin block.
6.2. DSC

![DSC traces](image)

**Fig. S27** DSC traces of P3HTs end-functionalized with π-extended porphyrins depending on the molar ratio of porphyrin block [a) 2a; b) 2b; c) 2c].
