Section 1. Materials and methods.

All manipulations involving air and/or moisture-sensitive compounds were carried out under a nitrogen atmosphere (ultra-high purity) using either standard Schlenk techniques or glove box techniques. Solvents were dried and distilled using standard procedures. Reagents were purchased and used as received without further purification. ZrCl$_4$(THF)$_2$ [S1], Ph$_3$CB(C$_6$F$_5$)$_4$ [S2], 2-tert-butyl-4-acetylphenol [S3] and complex 3 bis[N-(3-tert-butylsalicylidene)cyclohexylaminato]zirconium (IV) dichloride [S4] were prepared according to literature procedures. Polymerization grade ethylene was further purified by passage through columns of 5 Å molecular sieves. $^1$H and $^{13}$C NMR spectra were recorded on a Varian Mercury-300 NMR spectrometer, where chemical shifts (δ in ppm) were determined with a residual proton of the solvent as standard. Solid-state $^{13}$C CP/MAS NMR measurements were recorded on a Bruker AVANCE III 400 WB spectrometer at a MAS rate of 5 KHz and a CP contact time of 2 ms. Infrared spectra were recorded from 400 to 4000 cm$^{-1}$ on a Nicolet FT-IR 360 spectrometer by using KBr pellets. ESI-MS was carried out on a Thermo Fisher ITQ1100 ion trap gas chromatography-mass spectrometry. Elemental analyses were carried out on an Elementar model vario EL cube analyzer. Field emission scanning electron microscopy was performed on a SU8020 model HITACHI microscope. The Zirconium contents in polymer frameworks were determined by Perkin-Elmer ICP-OES Optima 3300DV spectroscopy. Powder X-ray diffraction data were recorded on a PANalytical BV Empyrean diffractometer by depositing powder on glass substrate, from 2θ = 4.0° to 40° with 0.02° increment at 25 ºC. Thermogravimetric analysis (TGA) was performed on a TA Q500 thermogravimeter by measuring the weight loss while heating at a rate of 10 ºC min$^{-1}$ from 25 to 800 ºC under nitrogen. Nitrogen sorption isotherms were measured at 77 K with a JW-BK 132F analyzer. Before measurement, the samples were degassed in vacuum at 150 ºC for more than 10 h. The Brunauer-Emmett-Teller (BET) method was utilized to calculate the specific surface areas and pore volume, the Saito-Foley (SF) method was applied for the estimation of pore size distribution. The molecular weight and molecular weight distribution of the polymer samples were measured on a PLGPC 220 at 140 ºC with 1,2,4-trichlorobenzene as the solvent. The melting points of the polymer were measured by differential scanning calorimetry (DSC) on a NETZSCH DSC 204 at a heating/cooling rate of 10 ºC min$^{-1}$ from 35 to 180 ºC and the data from the second heating scan were used.

**General procedure for synthesis of Cat 1a-c and Cat 2a-b**

In a typical procedure, NaH (40 mg, 1.7 mmol) was added to a THF (CH₂Cl₂ or dioxane) solution of 0.5 mmol of L₁H₃ (or L₂H₃). The solution was vigorously stirring at room temperature for 12 h. Then ZrCl₄(THF)₂ (0.75 mmol) was added, and the reaction mixture was refluxed for 3 days. The precipitate was collected by filtration, washed and dried under vacuum for 12 h. The self-immobilized catalysts 1a-c and 2a-b were obtained in 70–85% yields.

**Ethylene polymerization experiments**

A dry 250 mL steel autoclave with a magnetic stirrer was charged with 50 mL of toluene, and saturated with ethylene (1.0 bar). The autoclave was kept in a water bath at a corresponding temperature. The polymerization reaction was started by injection of a mixture of AlR₃, Ph₃CB(C₆F₅)₄ and a catalyst suspended in toluene (10 mL). The vessel was repressurized to the needed pressure with ethylene immediately, and the pressure was kept by continuously feeding of ethylene. After a certain period of time, the polymerization was quenched by injecting acidified methanol (HCl (3 M)/methanol 1/1). The polymer was collected by filtration, washed with water and methanol, and dried at 60 °C in vacuo to a constant weight. Most of the PCP catalyst should be retained in the polymer due to its insolubility in water and common organic solvents.
