1) General Information

Reagents including 2-idoaniline and its derivatives, 1,3-diones, α-aryl ketones, benzenacetaldehyde and 3-phenylpropanal were purchased and used as received without further purification. FeCl₃ (99.99%) was purchased from Sigma-Aldrich. NMR spectra of the products were recorded using a Bruker Advance TM spectrometer operating at 400 MHz for ¹H and 100 MHz for ¹³C in CDCl₃ unless otherwise noted. High resolution mass spectra (HRMS) of the products were obtained on a Bruker Daltonics micro TOF-spectrometer. Isolated yield was obtained by column chromatography (300-400 mesh), and ethyl acetate/petroleum ether (boiling range: 30-60 °C) was used as the eluent.
2) General Procedures for Preparation of Substrates (1o to 1r, 1u to 1x) and Spectra Analytical Data

1,3-Dicarbonyl compounds 1o, 1p, 1q, 1r, and substituted N-(2-(2-oxopropyl)phenyl)acetamides including 1u, 1v, 1w, 1x were prepared through previously reported methods.

A 50 mL Schlenk tube with a magnetic bar was charged with 1-phenylpropan-2-one (0.5 mmol), H$_2$O (0.5 mmol), FeCl$_3$ (0.05 mmol), and DMSO (2 mL). Then the tube was sealed and pressurized with 1.0 atm air after it was vacuumed and flushed with air three times. After that, it was stirred at 110 °C for 20 h. After cooling to room temperature, the reaction mixture was purified by column chromatography on silica gel to give product 2. Considering the volatility of the product, petroleum ether (boiling range: 30-60 °C) was used as the eluent and finally concentrated at 10 °C.

5) Mechanistic Study on the C–C Bond Cleavage

5.1 Control C–C bond cleavage reactions of 1a to investigate the role of H\(_2\)O.

C–C bond cleavage reaction of 1a in the absence of H\(_2\)O

In the glove-box, a mixture of 1a (0.5 mmol), FeCl\(_3\) (0.05 mmol) and molecular sieve (100 mg)
in 2mL anhydrous DMSO loaded in a Schlenk tube was stirred in 1 atm O₂ at 110 °C for 20 h. After cooling to room temperature, the mixture was purified by column chromatography using petroleum ether (boiling range: 30-60 °C) as the eluent and 4a was obtained in 43% yield while only trace of benzaldehyde was obtained. 49% yield of 1a was recovered. This control experiment suggested that the presence of H₂O is essential for this C–C bond cleavage.

1-phenylpropane-1,2-dione (4a)

Purified by column chromatography (PE with boiling range: 30-60 °C); yellow oil, 43% yield; Rf = 0.58 (10:1 PE/EA). 1H NMR (400 MHz, CDCl₃) δ 7.98–7.87 (m, 2H), 7.58–7.52 (m, 1H), 7.41 (t, J = 7.8 Hz, 2H), 2.44 (s, 3H). 13C NMR (100 MHz, CDCl₃) δ 200.6 (C=O), 191.4 (C=O), 134.6, 131.8, 130.3, 128.8, 26.4 (CH₃). HRMS (ESI) Calcd for C₉H₈NO₂: [M+Na]⁺, 171.0417; Found: 171.0415.

5.2 Control C–C bond cleavage reactions of 1a to investigate the role of air.

C–C bond cleavage reaction of 1a in the absence of air

In the glove box, a mixture of 1a (0.5 mmol), FeCl₃ (0.05 mmol) and H₂O (0.5 mmol) in 2mL degased DMSO loaded in a Schlenk tube was stirred at 110 °C for 20 h. After cooling to room temperature, the mixture was purified by column chromatography using petroleum ether (boiling range: 30-60 °C) as the eluent. Only trace of benzaldehyde was obtained and 60% of 1a was recovered. This control experiment suggested that the presence of O₂ (or air) is essential for this C–C bond cleavage.
5.3 Control C–C bond cleavage reactions of 1a in the presence of radical scavengers.

A mixture of 1a (0.5 mmol), FeCl₃ (0.05 mmol), ethene-1,1-diyldibenzene (1 mmol) and H₂O (0.5 mmol) in 2mL DMSO loaded in a Schlenk tube was stirred in 1 atm air at 110 °C for 20 h. After cooling to room temperature, the mixture was purified by column chromatography using petroleum ether (boiling range: 30-60 °C) as the eluent and 78% of benzaldehyde was obtained.

A mixture of 1a (0.5 mmol), FeCl₃ (0.05 mmol), 2,6-di-tert-butyl-4-methylphenol (1 mmol) and H₂O (0.5 mmol) in 2mL DMSO loaded in a Schlenk tube was stirred in 1 atm air at 110 °C for 20 h. After cooling to room temperature, the mixture was purified by column chromatography using petroleum ether (boiling range: 30-60 °C) as the eluent and 87% of benzaldehyde was obtained.
A mixture of 1a (0.5 mmol), FeCl₃ (0.05 mmol), 1,1,5,5-Tetramethylpentamethylene nitroxide (1 mmol) and H₂O (0.5 mmol) in 2mL DMSO loaded in a Schlenk tube was stirred in 1 atm air at 110 °C for 20 h. After cooling to room temperature, the mixture was purified by column chromatography using petroleum ether (boiling range: 30-60 °C) as the eluent and 85% of benzaldehyde was obtained. The results of SEq. 3, SEq. 4 and SEq. 5 suggested that a radical process might not be involved in the present transformation.

5.4 Reactions of 4a under standard conditions for C–C bond cleavage.

\[
\begin{align*}
\text{Ph} & \quad + \quad \text{H}_2\text{O} \\
4a & \quad \text{FeCl}_3 (10 \text{ mol\%}), \text{DMSO} \\
& \quad 110 \degree \text{C}, 20 \text{ h, in air} \\
& \quad \text{n. r.} \quad \text{SEq. 6}
\end{align*}
\]

A mixture of 4a (0.5 mmol), FeCl₃ (0.05 mmol), and H₂O (0.5 mmol) in 2 mL DMSO loaded in a schlenk tube was stirred in 1 atm air at 110 °C for 20 h. After cooling to room temperature, the mixture was detected by GC-MS and 4a was totally intact. This control experiment suggested that 4a was not the intermediate for this oxidative C–C bond cleavage.
