1. General procedures

All manipulations were performed under an atmosphere of argon, using standard Schlenk-type
glasswares on a dual-manifold Schlenk line. All solvents were dried and purified by usual procedures.\(^1\)
\(^1\)H and \(^{13}\)C NMR were measured with a JEOL ECX-400 spectrometer. The \(^1\)H NMR chemical shifts
are reported relative to tetramethylsilane (TMS, 0.00 ppm) or residual protiated solvent (7.26 ppm) in
CDCl\(_3\). The \(^{13}\)C NMR chemical shifts are reported relative to CDCl\(_3\) (77.0 ppm). MALDI-TOF mass
spectra were recorded on a Bruker Autoflex. Elemental analysis was carried out at Center for Organic
Elemental Microanalysis, Graduate School of Pharmaceutical Science, Kyoto University. Preparative
recycling gel permeation chromatography (GPC) was performed with a JAI LC9104 using CHCl\(_3\) as
the eluent at a flow rate of 14 mL min\(^{-1}\). GC analysis was carried out using Shimadzu GC-17A with a
capillary column (CBP-1, 0.25 mm i.d. \(\times\) 25 \(\mu\)m).

2. Synthesis of imidazolium salts

3.7. Calculation

An optimized structure of [PdCl(η³-C₃H₅)(1b-d)] (Fig. 2) was obtained by ONIOM⁴ calculations. In the ONIOM calculation, the molecular system of [PdCl(η³-C₃H₅)(1b-d)] was divided into two layers. The high layers were assigned to a [PdCl(η³-C₃H₅)(NHC)] core for B3LYP⁵/LANL2DZ⁶ calculation. The low layers contain the rest parts for molecular mechanics calculation using UFF force field.⁷ All calculations were performed with the Gaussian 03 program⁸ on a HIT HPC-IA64/SS 1.3/3D-4G.

The Connolly solvent-excluded volume⁹ was calculated using Chem 3D Ultra (ver. 7, Cambridge Soft) with a solvent probe radius of 1.4 Å. The solvent–excluded volume represents the volume of space that the probe is excluded from by collisions with the atoms of the van der Waals surface.
