General Remarks

All chemicals and solvents used were reagent grade and used as supplied unless otherwise specified. Analytical thin layer chromatography (TLC) was performed on Merck® silica gel 60 F254 glass or aluminium plates. Organic Compounds were visualized by UV (254 nm) irradiation. Flash column chromatography was carried out using forced flow or by gravity of the indicated solvent on Fluka® silica gel 60 (230 - 400 mesh). $^1$H and $^{13}$C NMR spectra were recorded on Bruker AV 300 spectrometer in CDCl$_3$ as solvent. Chemical shifts (δ) were referenced internally to residual protic solvent signal for CDCl$_3$ (7.26 ppm). Multiplicities are presented as singlet (s), doublet (d), triplet (t), quadruplet (q) and, multiplet (m). Coupling constants, (J) were expressed in Hertz (Hz). HRMS-ESI were run on an Agilent® 1200 Series LC/MSD. Infra-red spectra were recorded on a Perkin Elmer Spectrum 100 FT-IR spectrometer, the relevant absorbances are quoted as ν in cm$^{-1}$. Uncorrected melting points were determined using Stuart SMP10 melting point equipment using closed end glass capillary.

OPTIMIZATION OF THE REACTION CONDITIONS

General procedure for the optimization of the synthesis of propionic acid.

1-Nitropropane (89 μL, 1 mmol) and toluene (1 mL) were charged into a carousel tube followed by the addition of the corresponding catalyst (20 mol%) and the additive. After heating the reaction at 110 °C for 24 h, the reaction mixture was acidified with 5 mL of 2 M HCl and extracted with ethyl acetate. The organic phase was collected and dried using MgSO$_4$. The organic solvent was removed under vacuum and the crude reaction was analysed by $^1$H-NMR.

**Synthesis of benzoic acid in the presence of urea**

1-Nitromethylbenzene (137 mg, 1 mmol) and toluene (1 mL) were added into a carousel tube, followed by the addition of TBAI (19 mg, 5 mol%) and urea (3 mg, 5 mol%). After heating the reaction at 80 °C for 24 hours, the reaction mixture was acidified with 5 mL of 2 M HCl and extracted with ethyl acetate. The organic phase was collected and dried using MgSO<sub>4</sub>. The organic solvent was removed under vacuum and the crude reaction was analysed by <sup>1</sup>H-NMR. Benzoic acid was afforded in 80% conversion.

When this transformation was carried out using toluene as solvent, benzoic acid was recovered in 60% conversion (Table S3, entry 2). The outcome of the reaction was improved by the addition of urea to the reaction. This result was comparable to the use of water as solvent (Table S4, entry 2).
MECHANISTIC INSIGHTS

Conversion of nitromethylbenzene into benzoic acid under anaerobic conditions

Following the general procedure for the synthesis of benzoic acid, nitromethylbenzene was converted into benzoic acid under anaerobic conditions. For that purpose, all the glassware was purged with argon and the water was deoxygenated by bubbling argon through for 3 h. After heating the reaction at 80 °C for 24 h, the reaction mixture was acidified with 5 mL of 2 M HCl and extracted with ethyl acetate. The organic phase was collected and dried using MgSO₄. The organic solvent was removed under vacuum and the crude reaction was analysed by ¹H-NMR affording the benzoic acid in 60% conversion.

For comparison: standard reaction conditions led to the formation of benzoic acid in 95% conversion (Table S4, entry 4)

Study of the plausible intermediates

Following the general procedure for the synthesis of benzoic acid, benzamide (121 mg, 1 mmol), benzaldehyde (1 mL, 1 mmol), and benzaldehyde oxime (121 mg, 1 mmol) were treated with TBAI and Zn(OAc)₂. No reaction took place when benzamide and benzaldehyde oxime were employed. Benzaldehyde gave the benzoic acid in 97% conversion.

### SYNTHESIS OF THE STARTING MATERIALS

#### General procedure for the synthesis of nitro compounds.

Silver nitrite (2.3 g, 13 mmol) was added to a round bottom flask covered in tin foil containing anhydrous diethyl ether (26 mL). After stirring at room temperature for 15 minutes, the mixture was then cooled at 0 °C. A solution of benzylbromide (10 mmol) in diethyl ether (1.7 mL) was added dropwise via addition funnel. The reaction was stirred at 0 °C for 1 h and then heated to reflux for 4 h. The mixture was filtered over Celite using ethyl acetate as eluent. The product was purified by column chromatography on silica gel (eluting with 90:10 hexane/ethyl acetate unless otherwise stated).
(Nitromethyl)benzene

Benzyl bromide (1.71 g, 10 mmol) was used as alkyl halide. (Nitromethyl)benzene was recovered after purification by column chromatography as clear oil (1.16 g, 85%).

$^1$H NMR (300 MHz, CDCl$_3$, 25 °C) δ 7.50 - 7.45 (m, 5H, aromatic), 5.44 (s, 2H, CH$_2$); $^{13}$C NMR (75.5 MHz, CDCl$_3$, 25 °C) δ 130.1, 130.0, 129.7, 129.1, 80.07; HRMS-ESI calcd for [C$_7$H$_6$NO$_2$]: 136.0398 [M-H]. Found 136.0393; FT-IR (neat) ν in cm$^{-1}$: 1555.

4-Fluoro-(nitromethyl)benzene

4-Fluorobenzyl bromide (1.9 g, 10 mmol) was used as alkyl halide. 4-Fluoro-(nitromethyl)benzene was recovered after purification by column chromatography as clear oil (0.34 g, 87%).

**SYNTHESIS OF CARBOXYLIC ACIDS**

**General procedure for the synthesis of carboxylic acids**

The nitroalkane (1 mmol) and water (1 mL) were added in a carousel tube followed by the addition of TBAI (2 mol%) and zinc acetate (10 mol%). The reaction mixture was heated to 80 °C for 24 hours. The resulting reaction mixture was cooled down and acidified with 2 M HCl. The acidic solution was washed with dichloromethane (2 x 20 mL). The organic phases were collected and washed with a saturated solution of sodium bicarbonate (2 x 20 mL). The aqueous washes were acidified with HCl\(_{\text{conc}}\) and washed with dichloromethane (2 x 20 mL). The organic layers were collected and concentrated under reduced pressure. The carboxylic acids were isolated as pure products and they were analysed by \(^1\)H and \(^{13}\)C NMR and mass spectrometry.
Benzoic acid

Following the general procedure described above, benzoic acid was obtained as a white solid (0.98 g, 81%).

1H NMR (300MHz, CDCl₃, 25 °C) δ 11.43 (br s, 1H, OH), 8.15 (d, J = 6.0 Hz, 2H, aromatic), 7.63 (t, J = 6.0 Hz, 1H, aromatic), 7.49 (t, J = 6.0 Hz, 2H, aromatic); 13C NMR (75.5 MHz, CDCl₃, 25 °C) δ 172.5, 133.8, 130.2, 129.3, 128.5; HRMS -ESI calcd for [C₇H₅O₂]-: 121.0289 [M-H]-.
