Supporting Information for Structure analysis of a BEC-type germanosilicate zeolite including the location of the flexible organic cations in the channels

aLaboratory of Crystallography, ETH Zurich, Switzerland
bInstitute for Chemical and Bioengineering, D-CHAB, ETH Zurich, CH-8093 Zurich, Switzerland.

Figure S1. Thermogravimetric profile of the as-made Ge-BEC zeolite. The weight loss below 100°C corresponds to physisorbed water, the total organic content was calculated from the weight loss between 100 and 550°C.
**Figure S2.** $^{19}F$ spectra of the as-made Ge-BEC acquired at different spinning rates. The spinning side bands marked with a star are clearly identified by their positional shifts as a function of spinning rate and by their sharpness, which reflects the shape of the intense band associated with SiF$_6^{2-}$ species at -123 ppm.
