I. Synthesis and Characterization

**Instrumentation:** $^1$H and $^{13}$C-NMR spectra were recorded on Bruker Avance III 500 MHz NMR spectrometer and the chemical shifts (δ) are reported in parts per million (ppm) using residual solvent signals as internal standards. FTIR measurements were carried out on Perkin Elmer FTIR spectrophotometer. Ten scans were signal-averaged, with a resolution of 2 cm$^{-1}$ at room temperature. KBr pellet was used for the measurements. The surface morphology and size of the nanoparticles were examined using Carl Zeiss (Ultraplus) field emission scanning electron microscope (FESEM).

**Chemicals:** All chemicals were used as received unless stated otherwise. Indole-3-carboxaldehyde (97%), 5-bromo-3-carboxaldehyde (98%), 4-octyne (99%), copper(II) acetate monohydrate (99%), palladium(II) acetate (99.9%), 4-aminobenzophenone (90%), 4-bromobenzophenone (98%), diphenylmethane (99%), p-toluenesulfonic acid monohydrate (98.5%), bis(pinacolato) diboron (99%), [1,1'-bis(diphenylphosphino)ferrocene]dichloropalladium(II) complex with dichloromethane, bis(triphenylphosphine)palladium(II) dichloride (98%), dimethyl sulfoxide (99%), toluene (99.85%), tetrakis(triphenylphosphine)palladium(0) (99.9%), L-cysteine (97%), DL-homocysteine (95%) and triethylamine (99%) were received from Sigma-Aldrich. Sodium hydroxide (99%), potassium carbonate, acetic acid, 1,2-dioxane, chloroform and hexane were received from Merck. THF (99%), trifluoroacetic acid, ethanol (99.8%), extra pure concentrated HCl were received from Spectrochem.

**Reaction schemes:**

![Reaction scheme](image)

**Scheme S1.** Synthesis of pyrido[1,2-a]indole derivatives (1, 2).¹
Scheme S2. Synthesis of 1-(4-aminophenyl)-1,2,2-triphenylethene (3).²

Scheme S3. Synthesis of 1-(4-bromophenyl)-1,2,2-triphenylethylene (3a) and 4,4,5,5-tetramethyl-2-(4-(1,2,2-triphenylvinyl) phenyl)-1,3,2-dioxaborolane (4).³
Scheme S4. Synthesis of PITE1 and PITE2.

Synthesis of compounds 1 and 2:

In a 100 mL round-bottom flask, substituted 3-carboxaldehyde (1 eqv.) and 4-octyne (2 eqv.) were stirred in toluene (10 mL) at RT and purged with argon for 5 min. Pd(OAc)$_2$ (5 mol %) and Cu(OAc)$_2$ (1.8 eqv.) were added to the resultant clear solution, which was further purged with argon for 5 min. The reaction mixture was stirred at 110$^\circ$C for 36 h. After completion the reaction was quenched with water and the mixture was extracted with ethyl acetate. The resulting organic solution was washed with brine, dried over anhydrous MgSO$_4$, filtered, and concentrated. The resulting residue was purified by silica gel flash column chromatography (EtOAc/hexane) to afford 1 and 2. The $^1$H NMR data for the compounds are given below.

**1**: $^1$H NMR: $\delta$H (500 MHz, CDCl$_3$) 10.46 (1 H, s), 9.01 (1 H, d, $J$ 8.1), 7.94 (1 H, d, $J$ 8.7), 7.49 (1 H, q, $J$ 7.0), 7.34 – 7.28 (1 H, m), 3.38 – 3.26 (2 H, m), 3.09 – 2.98 (2 H, m), 2.77 – 2.61 (4 H, m), 1.99 – 1.83 (2 H, m), 1.78 (2 H, tt, $J$ 15.1, 7.4), 1.68 – 1.51 (4 H, m), 1.29 – 1.19 (3 H, m), 1.11 (9 H, dd, $J$ 13.7, 7.2).

$^{13}$C NMR: $\delta$C (126 MHz, CDCl$_3$) 184.25, 143.44, 142.61, 139.71, 131.86, 130.36, 128.41, 125.65, 124.61, 122.84, 121.91, 115.41, 107.42, 32.79, 31.81, 31.72, 30.83, 24.77, 24.23, 22.20, 21.35, 14.90, 14.74, 14.30, 13.85.
FTIR (frequency/cm$^{-1}$): 2960, 2870, 1616, 1470, 1380, 732.

MS (MALDI-ToF): Calculated for C$_{25}$H$_{33}$NO is 363.26 and found 363.140.

2: $^1$H NMR: $\delta$H (500 MHz, CDCl$_3$) 10.43 (1 H, s), 9.21 (1 H, d, J 2.2), 7.79 (1 H, d, J 9.2), 7.41 (1 H, dd, J 9.2, 2.2), 3.36 – 3.26 (2 H, m), 3.07 – 2.99 (2 H, m), 2.78 – 2.64 (4 H, m), 1.95 – 1.83 (2 H, m), 1.78 (2 H, dt, J 19.4, 7.5), 1.66 – 1.53 (4 H, m), 1.29 – 1.19 (3 H, m), 1.19 – 1.10 (9 H, m).

$^{13}$C NMR: $\delta$C (126 MHz, CDCl$_3$) 184.18, 143.64, 143.22, 139.56, 131.89, 130.48, 128.47, 125.15, 125.05, 124.70, 119.80, 116.68, 106.81, 32.73, 31.76, 31.74, 30.83, 24.73, 24.21, 22.18, 21.13, 14.90, 14.73, 14.28, 13.81.

FTIR (frequency/cm$^{-1}$): 2956, 2930, 2872, 1624, 1440, 778.

MS (MALDI-ToF): Calculated for C$_{25}$H$_{32}$BrNO is 441.17 and found 442.13 (M+1).

**Synthesis of 1-(4-aminophenyl)-1,2,2-triphenylethene (3):**

In a two-necked RB flask equipped with a magnetic stirrer, zinc powder (2.6 g, 40.7 mmol) and 40 mL of THF were added. After the mixture was cooled to –5°C, TiCl$_4$ (2.2 mL, 20.3 mmol) was slowly added by a syringe. The mixture was brought to room temperature and stirred for 30 min and then refluxed for 3 h. A solution of benzophenone (1.1 g, 6.1 mmol) and 4-aminobenzophenone (1 g, 5.1 mmol) in 20 mL THF was added slowly. After complete addition, the reaction mixture was refluxed for 12 h. After cooling to room temperature, the reaction mixture was quenched with 10% aqueous solution of K$_2$CO$_3$ and then extracted with dichloromethane. The organic layer was collected and concentrated. The crude product was purified by silica-gel column chromatography to give a light yellow solid in 48% yield (845 mg).

$^1$H NMR: $\delta$H (500 MHz, CDCl$_3$) 7.17 – 6.95 (15 H, m), 6.85 – 6.74 (2 H, m), 6.46 – 6.37 (2 H, m), 3.58 (2 H, s).

$^{13}$C NMR: $\delta$C (126 MHz, CDCl$_3$) 144.78, 144.35, 144.22, 144.18, 140.95, 139.32, 134.03, 132.49, 131.47, 131.41, 131.36, 127.67, 127.54, 127.51, 126.24, 126.06, 114.32.

FTIR (frequency/cm$^{-1}$): 3440-3480 (broad), 3380, 3022, 1618, 1512, 1280.

MS (MALDI-ToF): Calculated for C$_{26}$H$_{21}$N is 347.17 and found 347.05.
Synthesis of 1-(4-bromophenyl)-1,2,2-triphenylethylene (3a):

To a solution of diphenylmethane (1 g, 6.0 mmol) in dry tetrahydrofuran (10 mL), 2 mL of 2.5 M solution of n-butyllithium in hexane (10 mmol) was added at 0°C under an argon atmosphere. The resulting orange-red solution was stirred for 45 min at 0°C. To this solution an appropriate amount of 4-bromobenzophenone (1.2 g, 4.5 mmol) was added, and the reaction mixture was brought to room temperature and stirred for 6 h. Then the reaction mixture was quenched with the addition of an aqueous solution of ammonium chloride (10%), the organic layer was extracted with dichloromethane (3 × 50 mL), and the combined organic layers were washed with a saturated brine solution and dried over anhydrous MgSO₄. The solvent was evaporated, and the resulting crude alcohol (containing excess diphenylmethane) was subjected to acid-catalyzed dehydration as follows.

The crude alcohol was dissolved in a 30 mL of toluene in a 100 mL RB flask fitted with a Dean-Stark trap. A catalytic amount of p-toluenesulphonic acid (0.2 g, 1.2 mmol) was added, and the mixture was refluxed for 3-4 h and cooled to room temperature. The toluene layer was washed with 10% aqueous NaHCO₃ solution (2 × 25 mL) and dried over anhydrous MgSO₄ and evaporated to afford 3a. The crude product was purified by a simple silica gel column chromatography from a mixture of dichloromethane and hexane to give the target compound as white solid in yield 50% (1.23 g).

^1H NMR:  δ_H (500 MHz, CDCl₃) 7.22 (2 H, d, \( J \) 8.5), 7.14 – 7.08 (9 H, m), 7.04 – 6.99 (6 H, m), 6.90 (2 H, d, \( J \) 8.5).

^13C NMR:  δ_C (126 MHz, CDCl₃) 143.41, 143.33, 143.22, 142.70, 141.61, 139.66, 132.98, 131.30, 131.25, 131.23, 130.85, 127.88, 127.78, 127.68, 126.70, 126.65, 126.60, 120.45.

FTIR (frequency/cm\(^{-1}\)): 3074, 3022, 1598, 1490, 1070, 692.

MS (MALDI-ToF): Calculated for C₂₆H₁₉Br is 410.07 and found 410.962.

Synthesis of 4,4,5,5-tetramethyl-2-(4-(1,2,2-triphenylvinyl) phenyl)-1,3,2-dioxaborolane (4):

A mixture of 3a (0.4 g, 0.97 mmol), 4,4,4',4',5,5,5',5'-octamethyl-2,2'-bi(1,3,2-dioxaborolane) (0.35 g, 1.4 mmol), [Pd(dpff)]Cl₂ (0.024 g, 0.03 mmol), and potassium acetate (0.3 g, 3.5 mmol) in degassed 1,2-dioxane (10 mL) was stirred at 90°C for 24 h. The reaction was quenched by
adding water, and the mixture was washed with dichloromethane. The organic layer was collected, dried over MgSO$_4$ and concentrated in vacuum. The crude product was then purified by silica gel column chromatography (hexane/dichloromethane) to give the target compound as white solid in 67% yield (300 mg).

$^1$H NMR: $\delta_H$ (500 MHz, CDCl$_3$) 7.54 (2 H, d, J 8.2), 7.12 – 7.06 (9 H, m), 7.06 – 6.98 (8 H, m), 1.32 (12 H, s).

$^{13}$C NMR: $\delta_C$ (126 MHz, CDCl$_3$) 146.76, 143.69, 143.59, 143.51, 141.37, 140.84, 134.08, 131.35, 131.32, 131.30, 130.69, 127.72, 127.63, 126.52, 126.45, 126.43, 83.69, 24.91.

FTIR (frequency/cm$^{-1}$): 2982, 1608, 1360, 1147, 700.

MS (MALDI-ToF): calculated for C$_{32}$H$_{31}$BO$_2$ is 458.41 and found 458.292.

Synthesis of 1-(1,2,3,4-tetrapropyl-4aH-fluoren-9-yl)-N-(4-(1,2,2-triphenylvinyl)phenyl) methanimine (PITE1):

In a 50 mL round-bottom flask, 1 (1 eqv.) and 3 (1 eqv.) were refluxed in ethanol in presence of few drops of acetic acid for 6 h. After cooling the reaction mixture to room temperature an orange solid was obtained and filtered (yield 50%).

$^1$H NMR: $\delta_H$ (500 MHz, CDCl$_3$) 9.26 (1 H, dd, J 8.2, 1.4), 9.11 (1 H, s), 7.98 (1 H, d, J 8.8), 7.51 – 7.44 (1 H, m), 7.30 (1 H, s), 7.13 (13 H, dtt, J 7.7, 4.2, 2.1), 7.09 – 7.06 (1 H, m), 7.05 (4 H, d, J 1.8), 3.42 – 3.27 (2 H, m), 3.07 – 2.92 (2 H, m), 2.74 – 2.60 (4 H, m), 1.92 (2 H, q, J 7.8), 1.84 – 1.72 (2 H, m), 1.66 – 1.53 (4 H, m), 1.25 (3 H, t, J 7.3), 1.13 (6 H, td, J 7.3, 2.5), 1.04 (3 H, t, J 7.3).

$^{13}$C NMR: $\delta_C$ (126 MHz, CDCl$_3$) 156.06, 144.14, 144.13, 144.07, 141.06, 140.64, 140.17, 139.54, 139.53, 139.35, 138.79, 137.61, 133.72, 132.23, 131.56, 131.44, 131.42, 129.66, 127.91, 127.71, 127.58, 127.56, 126.32, 126.24, 126.18, 124.31, 123.31, 121.12, 120.23, 115.11, 103.86, 32.44, 31.83, 31.53, 30.84, 24.84, 24.37, 22.88, 21.33, 14.88, 14.75, 14.20, 13.88.

FTIR (frequency/cm$^{-1}$): 3444 (broad), 2960, 1562, 1472, 1372, 1216, 698.

MS (MALDI-ToF): calculated for C$_{31}$H$_{52}$N$_2$ is 692.99 and found 693.892.
Synthesis of 6,7,8,9-tetrapropyl-2-(4-(1,2,2-triphenylvinyl) phenyl)pyrido[1,2-ajindole-10-carbaldehyde (PITE2):

A mixture of 2 (72 mg, 0.16 mmol) and 4 (75 mg, 0.16 mmol), K$_2$CO$_3$ (23 mg, 0.16 mmol), TBABr (5 mg, 0.015 mmol) and [Pd(PPh$_3$)$_4$] (5.6 mg, 0.005 mmol) was degassed. Then, water (1 mL) and toluene (10 mL) were added. The resulting mixture was stirred at 95°C for 24 h under an argon atmosphere. After cooling to room temperature, the reaction mixture was quenched by adding water and extracted with dichloromethane. The organic layer was collected, dried over MgSO$_4$ and concentrated in vacuum. The product was purified by silica gel column chromatography (eluent: hexane/dichloromethane) to give the desired compound as light green solid in 68% yield (75 mg).

$^1$H NMR: $\delta$H (500 MHz, CDCl$_3$) 10.46 (1 H, s), 9.23 (1 H, d, $J$ 1.8), 7.94 (1 H, d, $J$ 9.1), 7.58 – 7.49 (3 H, m), 7.16 – 7.08 (15 H, m), 7.08 – 7.04 (2 H, m), 3.37 – 3.29 (2 H, m), 3.07 – 2.99 (2 H, m), 2.75 – 2.63 (4 H, m), 1.96 – 1.71 (4 H, m), 1.56 (4 H, d, $J$ 6.2), 1.23 (3 H, t, $J$ 7.3), 1.12 (9 H, q, $J$ 7.1),

$^{13}$C NMR: $\delta$C (126 MHz, CDCl$_3$) 184.20, 143.92, 143.83, 143.81, 143.76, 142.58, 140.96, 140.72, 139.58, 138.99, 138.13, 131.71, 131.47, 131.40, 131.35, 131.16, 130.88, 128.41, 127.80, 127.66, 127.61, 126.76, 126.54, 126.42, 126.33, 124.70, 121.16, 120.59, 115.57, 107.60, 32.77, 31.80, 31.75, 30.86, 24.78, 24.24, 22.21, 21.27, 14.92, 14.75, 14.32, 13.86.

FTIR (frequency/cm$^{-1}$): 3436 (broad), 2960, 2870, 1620, 1444, 698.

MS (MALDI-ToF): Calculated for C$_{51}$H$_{51}$NO is 693.98 and found 693.440.
II. Crystal structures

**Instrumentation:** Crystals of both PITE1 and PITE2 were grown from a mixture of ethyl acetate and ethanol through slow evaporation. Single-crystal X-ray diffraction data was collected using a Bruker APEX II diffractometer equipped with a CCD area detector using Mo Kα radiation (λ = 0.71073 Å) in phi(ϕ) and omega(ω) scan. The data collections for the PITE1 and PITE2 are obtained at 140 K and 150 K, respectively. The data collection was carried out giving an exposure time of 15 seconds per frame for PITE1 and 10 seconds per frame for PITE2 and at the crystal-to-detector distance of 6 cm. The data collection, unit cell measurements, integration, scaling and absorption corrections were done using Bruker Smart Apex II software. The intensity data was processed by using the Bruker SAINT Program suite. The crystal structures were refined by the full matrix least squares method using SHELXL97 present in the program suite WinGX (version 2014.1). Empirical absorption correction was applied using SADABS and the crystal packing diagrams were generated using Mercury 3.7 and Materials Studio 6.1. The detailed crystallographic data and the structure refinement parameters were summarized in Table S1.

The crystal structure investigation of PITE1 reveals the strong Π-Π stacking interaction (3.29 Å) responsible for fluorescence quenching. Such π-π stacking interaction (8.84 Å) is absent in PITE2. In addition, the existence of a range of weak intramolecular interactions such as C−H⋯π and C−H⋯H−C are found to be responsible for restriction of intramolecular rotation in PITE2 leading to strong fluorescence in the solid state. The short contacts in PITE1 and PITE2 are shown in Fig. S2 and indicated in Table S2. In the molecular structure of PITE2, there are 12 numbers of short contacts (C−H⋯π and C−H⋯H−C) involving TE unit compared to 8 such contacts in PITE1.

III. Spectroscopic data

**Instrumentation:** The UV-Vis absorption spectra were recorded on a Cary 100 spectrophotometer. Steady-state fluorescence measurements were carried out on a Jobin Yvon Horiba Model Fluorolog-3-21. Time-resolved fluorescence measurements were carried out using time-correlated single-photon counting (TCSPC) spectrometer (Delta Flex-01-DD/HORIBA). Delta diode laser 408 nm with FWHM = 198 ps was used as excitation source. Picosecond photon detection module with photomultiplier tube was used as detector. Instrument response function was recorded by using aqueous solution of Ludox. Decay curves were analyzed by nonlinear least-squares iteration using IBH DAS6 (version 6.8) decay analysis software.

**Fluorescence quantum yield (Φₚ) measurement:**

The fluorescence quantum yields of PITE1 and PITE2 in different solvents and aqueous dispersion of nanoparticles were estimated by comparison with coumarin-153 in ethanol (Φᵢ = 0.53). The quantum yields were calculated using the following equation:

\[ Φ_{f,x} = Φ_{f,s} \cdot F_x \cdot \frac{f_x}{f_s} \cdot \frac{n_s^2}{n_x^2} \]

where, \( Φ_f \) is fluorescence quantum yield, subscript x denotes unknown sample and subscript s refers to standard. F denotes integral fluorescence, n refers to refractive index of the solvent used in the measurements and \( f \) is the absorption factor at the excitation wavelength given by the following equation:

\[ f = 1 - 10^{-ε(λ_ex)c} = 1 - 10^{-A(λ_ex)} \]

where \( A \) is absorbance and \( ε = \text{molar extinction coefficient} \)

in L mol\(^{-1}\) cm\(^{-1}\).

The fluorescence quantum yield of PITE2 powder was estimated using a calibrated integrating sphere (Quanta-Phi, Horiba).

IV. Future prospects of PITE1 and PITE2

The presence of imine bond in PITE1 leads to the quenching of fluorescence in the solution state due to the photoinduced electron transfer (PeT) processes. The addition of thiol-containing compounds like cysteine and homocysteine to the solution of PITE1 leads to the cleavage of imine bond. Subsequently, the fluorescence of the pyridoindole moiety observed demonstrating PITE1 as a prospective ‘turn-on’ fluorescent sensor (Fig. S10, S11).

**Fig. S10.** Images under UV light (\(\lambda_{ex} = 365\) nm) of (i) 5 µM PITE1 in THF, (ii) 5 µM PITE1 with 3 mM L-cysteine and (iii) 5 µM PITE1 with 1.6 mM homocysteine.

**Fig. S11.** Emission spectra (\(\lambda_{ex} = 410\) nm) of (a) PITE1 with L-cysteine and (b) PITE1 with homocysteine: (i) 5 µM THF solution of PITE1 and (ii) the solution of PITE1 with the corresponding thiol.
The addition of trifluoroacetic acid (TFA) to the solution of **PITE2** completely quench the fluorescence and subsequent addition of triethylamine (TEA) leads to the regaining of fluorescence (Fig. S12, S13).

**Fig. S12.** Images under UV light ($\lambda_{ex} = 365$ nm) of 5 µM **PITE2** in (i) Chloroform, after adding (ii) TFA and (iii) TEA.

**Fig S13.** Emission spectra of 5 µM solution of **PITE2** in (i) Chloroform, (ii) Chloroform + 10 µL TFA and (iii) addition of 10 µL TEA in (ii).
