Synthesis of 4-n-alkoxy 4-(5-octyl-2-thienyl)-benzoates (T2-T14)

The esters were prepared by the reaction between appropriate 4-n-alkoxy 4-(5-octyl-2-thienyl) benzoic acids with alkoxy phenols using DCC/DMAP reagent with good yields. The starting methyl 4-(5-octylthiophen-2-yl) benzoate was prepared in a single step coupling with 2-octylthiophene and 4-bromo methyl benzoate using palladium acetate as a catalyst by direct arylation method.

WAXS and SAXS of T10 mesogen:

Wide-angle and small-angle X-ray scattering measurements were carried out on XEUSS SAXS/WAXS system using a Genixmicro source from Xenocs operated at 50 kV and 0.6 mA. The Cu K\text{α} radiation (\(\lambda = 1.54 \text{ Å}\)) was collimated with a FOX2D mirror and two pairs of scatterless slits from Xenocs. The 2D-patterns were recorded on a Mar345 image plate and processed using Fit2D software. These measurements were made in the transmission mode. Silver behenate was used as standard materials for calibration of the scattering vectors of SAXS and WAXS. Mar 345 dtb image plate detector was set at 1050 mm and 221.75 mm from the sample in the direction of the beam for SAXS and WAXS data collections, respectively. XEUSS SAXS/WAXS system is equipped with a Linkam THMS 600 hot stage and a Linkam TMS 93 programmable temperature controller. The Linkam hot stage was
connected to the LNP 95 cooling system, which cools the stage to liquid nitrogen temperature. The flow of nitrogen was automatically adjusted with the help of T95 controller.

During the $t_1$ period, the heteronuclear $^{13}$C-$^1$H dipolar couplings are evolved and the homonuclear $^1$H-$^1$H dipolar couplings are suppressed by “magic sandwich” pulses. Finally $^{13}$C signals acquired during $t_2$ period with the heteronuclear decoupling by SPINAL-64 pulse sequence. Here the darker boxes represent 90° pulses.
