S2 Experimental Details and Spectroscopic Data

General remarks. IR spectra were measured on a Bruker ALPHA P FT-IR spectrometer equipped with a diamond ATR attachment. Raman spectra of samples in flame-sealed capillaries were recorded using a Bruker Equinox 55 FRA 106/S FT-Raman spectrometer equipped with a highly sensitive Ge detector and a Nd:YAG-Laser (1064 nm). NMR spectra were measured on a Bruker Avance 400 and a Bruker AvanceIII 600 spectrometer in 5 mm NMR tubes at room temperature. Chemical shifts are given with respect to Me$_4$Si ($^{1}$H, $^{13}$C) and BF$_3$·OEt$_2$ ($^{11}$B). Two dimensional NMR experiments (HSQC (Heteronuclear Single Quantum Coherence), HMBC (Heteronuclear Multiple Bond Correlation) and COSY(Correlated Spectroscopy)) were performed to assist the assignment of the spectra. Electrospray ionization (ESI) mass spectra were recorded using a Bruker micrOTOF instrument. Thermoanalytical measurements were done with a Mettler Toledo TGA/DSC 1
LSTAR System. The coupled thermo gravimetric / mass spectrometric measurements were carried out with a Mettler Toledo TGA/DSC 1 LSTAR System connected to a Pfeiffer Vacuum Thermostar Gas Analysis System and a Gas Controller GC 200.

S2.1 Synthetic Details and Spectroscopic Data for $M_2[B_{12}H_{11}OH]^2-$ ($M = \text{Na, K}$)

In the following the synthesis is described exemplarily for $K_2[B_{12}H_{11}OH]$. In a 500 ml three necked round flask 5.0 g (22.7 mmol) of $K_2[B_{12}H_{12}]$ were dissolved in 220 ml of water. In the next step 148 ml of $H_2SO_4$ (96 %) were slowly dropped into the solution (1 – 2 drops per second). Over the whole time the solution was cooled with an ice/water mixture. After the adding of the sulfuric acid the cooling was removed and the reaction mixture was heated to 90 °C, which was checked by a thermal measurement in the flask. After 120 minutes the reaction was stopped and the solution was transferred into a 1 l Erlenmeyer flask. The solution was neutralized with solid $NaOH$. Precipitating potassium- and sodium sulfate were removed by filtration several times throughout the whole neutralization process. After finishing the clear and colorless solution was directly used for next step. The product contained small amounts of unreacted $[B_{12}H_{12}]^2-$ and also twofold hydroxylated clusters, because the reaction was controlled by time.

$^{11}B\ \{^{1}H\}\ NMR\ (128.38\ MHz,\ D_2O,\ 298\ K):\ \delta = 0.67\ (s,\ 1B, \ B1-O),\ -19.1\ (s,\ 5B, \ B(2-6)-Cl),\ -17.8\ (s,\ 5B, \ B(7-11)-Cl),\ -22.7\ (s,\ 1B, \ B1-Cl)).$

S2.2 Synthetic Details and Spectroscopic Data for Na₂[B₁₂Cl₁₁OH]

Chlorine gas was bubbled through a solution of M₂[B₁₂H₁₁OH] (prepared in the previous step) for 24 h while heating the reaction mixture to reflux. The progress of the chlorination reaction was checked by $^{11}$B and $^{11}$B{${}^1$H} NMR spectroscopy. When the chlorination was completed the solution was cooled down to room temperature and triethylamine was added. The pH value was checked to be weakly acid (~3). The mixture was stirred for a few hours to dissolve all of the triethylamine. The white precipitate was removed by filtration, washed with cold water, and dried at 110 °C under reduced pressure. The solid was transferred to a Teflon beaker and two equivalents of solid NaOH dissolved in water were added. The completeness of the metathesis reaction was checked by $^1$H NMR spectroscopy (absence of any triethylamine traces). The water was removed by heating and the product was obtained as a colorless solid 8.14 g (13.96 mmol, 62%, based on 5.00 g Na₂[B₁₂H₁₂]).

$^{11}$B $^1$H NMR (128.38 MHz, D₂O, 298 K): $\delta$ = -7.4 (s, 1B, B₁-O), -13.9 (s, 10B, B(2-11)-Cl), -15.8 (s, 1B, B₁₂-Cl)). IR (ATR): $\tilde{\nu}$ = 3597 (w, sh), 2291 (vw), 2080 (vw), 1980 (vw), 1607 (vw), 1316 (vw), 1249 (w), 1211 (w), 1089 (m, sh), 1029 (s, sh), 794 (vw), 743 (vw), 711 (vw), 585 (m, sh), 545 (s, sh), 534 (vw), 456 (vw), 427 (w). Raman: $\tilde{\nu}$ = 1624 (vw), 1153 (vw), 994 (m), 409 (w), 317 (m), 301 (vs), 132 (s) cm⁻¹. ESI-MS (− mode, D₂O): m/z: 268 [B₁₂Cl₁₁OH]$^-$, 559 [B₁₂Cl₁₁OH + Na$^-$].

S2.3 Synthetic Details and Spectroscopic Data for Na$_2$[B$_{12}$Br$_{11}$OH]

Methanol (approximately the same volume) was added to a solution of K$_2$[B$_{12}$H$_{11}$OH] prepared in the previous step. Potassium- and sodium sulfate precipitated and were removed by filtration. To the solution 30 ml of bromine were added dropwise and subsequently the reaction mixture was heated to reflux. Another 30 ml of bromine were added to the refluxing solution and the progress of the bromination reaction was checked by $^{11}$B and $^{11}$B {$^1$H} NMR spectroscopy. After 24 h the solution was cooled down to room temperature and all volatiles were removed under reduced pressure. The residue was dissolved in water and the solution was acidified by adding HCl. Triethylamine was added to the solution and the pH value was checked to be still weakly acid (~ 3). The mixture was stirred for a few hours to dissolve all of the triethylamine. The white precipitate was removed by filtration, washed with cold water, and dried at 110 °C under reduced pressure. The solid was transferred to a Teflon beaker and two equivalents of solid NaOH dissolved in water were added. The absence of any traces of triethylamine was checked by $^1$H NMR spectroscopy. The water was removed by heating and the product was obtained as a colorless solid 13.49 g (12.59 mmol, 55%, based on 5.00 g Na$_2$[B$_{12}$H$_{12}$]).

$^{11}$B NMR (128.38 MHz, CD$_3$CN, 298 K): $\delta = -4.2$ (s, 1B, $B1$-O), $-14.1$ (s, 10B, $B$(2-11)-Cl), $-16.6$ (s, 1B, $B12$-Cl)). IR (ATR): $\tilde{\nu} = 3674$ (w, sh), 3342 (vw), 3115 (vw), 2447 (vw), 2284 (vw), 2162 (vw), 2050 (vw), 1988 (vw), 1925 (vw), 1792 (vw), 1559 (vw), 1435 (vw), 1315 (vw), 1266 (vw), 1233 (vw), 1197 (m, sh), 1095 (s, sh), 1000 (s, sh), 989 (vs, sh), 909 (vw), 880 (vw), 728 (vw), 676 (vw), 582 (w), 536 (s, sh), 448 (vs, sh), 413 (w) cm$^{-1}$. Raman: $\tilde{\nu} = 539$ (vw), 351 (w), 196 (vs) cm$^{-1}$. ESI-MS (– mode, D$_2$O): m/z: 512 [B$_{12}$Br$_{11}$OH]$^{2-}$.
