SUPPORTING INFORMATION

General

$^1$H, $^{13}$C and $^{19}$F NMR spectra were measured on a Bruker AV300M (300 MHz) spectrometer. Chemical shifts of $^1$H NMR were expressed in parts per million down field from tetramethylsilane as an internal standard ($\delta = 0$) in CDCl$_3$. Chemical shifts of $^{13}$C NMR were expressed in parts per million in CDCl$_3$ as an internal standard ($\delta = 77.0$). Chemical shifts of $^{19}$F NMR were expressed in parts per million downfield from BTF as an external standard ($\delta = -63.24$) in CDCl$_3$. Important NMR data were tabulated in following order: multiplicity (s: singlet, d: doublet, t: triplet, q: quartet, quint: quintet, sext: sextet, sept: septet, m: multiplet, brs: broad singlet, brm: broad multiplet) and coupling constant ($J$ (Hz)).

IR spectra were measured on a JASCO FT/IR-4200 spectrometer.

Mass spectra were measured on a JEOL JMS-T100CS.

Analytical thin layer chromatography (TLC) was performed on a glass plates pre-coated with silica-gel (Merck Kieselgel 60 F$_{254}$, layer thickness 0.25 mm). Visualization was accomplished by UV light (254 nm), anisaldehyde, KMnO$_4$ and phosphomolybdic acid.

Column chromatography was performed on KANTO Silica Gel 60N (spherical, neutral).

Anhydrous diethyl ether, tetrahydrofuran, dichloromethane and 1,4-dioxane were purchased from Kanto Chemical Co., Inc. Anhydrous dimethylsulfoxide was purchased from Sigma-Aldrich Co., Inc.

All experiments were carried out under argon atmosphere otherwise noted.

General procedure for the perfluoroalkylation of aldehydes, ketones and esters

To a solution of Cp$_2$ZrCl$_2$ (70.2 mg, 0.24 mmol) in Et$_2$O (2.4 mL) was added $^6$BuMgCl (2.0 M in Et$_2$O, 0.12 mL, 0.24 mmol), 1,4-dioxane (23 $\mu$L, 0.27 mmol) and perfluorohexyl iodide (78 $\mu$L, 0.36 mmol) (and methylaluminoxane (10 wt% in toluene, 0.16 mL, 0.24 mmol)) at -78°C. After stirring at -78°C for 1 h, benzaldehyde (1b) (20 $\mu$L, 0.20 mmol) was added. The reaction mixture was then stirred at room temperature for 1 h, quenched by 1 N HCl and extracted three times with Et$_2$O. Combined organic layer was dried over Na$_2$SO$_4$ and the solvent was removed in vacuo. The crude product was purified by silica gel column chromatography (Hexane/AcOEt = 20/1) to give 2,2,3,3,4,4,5,5,7,7,7-tridecafluoro-1-phenylheptan-1-ol (2b) (85.2 mg, >99%).

After stirring at room temperature for 12 h, the reaction was quenched with saturated aq. Na\(_2\)S\(_2\)O\(_3\) at 0 °C. The organic layer was separated, washed with water and dried over Na\(_2\)SO\(_4\). * The solid density of Cp\(_2\)ZrCl\(_2\) is 1.70 g/cm\(^3\). However, our reference system is optimized to test complexes with density 0.9 g/cm\(^3\) (liquid density) ~ 1.0 g/cm\(^3\) (solid density). Therefore, the predicted FWS of Cp\(_2\)ZrCl\(_2\) here are on the base of assumption that the density of Cp\(_2\)ZrCl\(_2\) particle is around 1.0g/cm\(^3\).
