General Information

Reagents were purchased from chemical companies. All the reactions were performed in sealed tube and monitored by TLC (0.2 mm silica gel-coated HSGF 254 plates). The products were purified by flash column chromatography (200-300 mesh silica gel) eluted with the gradient of petroleum ether and ethyl acetate. Proton nuclear magnetic resonance spectra (1H NMR) were recorded on a Bruker 500 MHz NMR spectrometer (CDCl₃ or DMSO-d₆ solvent). The chemical shifts were reported in parts per million (ppm), downfield from SiMe₄ (δ 0.0) and relative to the signal of chloroform-d (δ 7.26, singlet) or dimethyl sulfoxide-d₆ (δ 2.54, singlet). Multiplicities were given as: s (singlet); d (doublet); t (triplet); q (quartet); dd (doublets of doublet) or m (multiplets). The number of protons for a given resonance is indicated by nH. Coupling constants are reported as a J value in Hz. Carbon nuclear magnetic resonance spectra (¹³C NMR) were reported in ppm using solvent CDCl₃ (δ (ppm) = 77.16 ppm) as an internal standard. HRMS analyses were performed on a Waters XEVO QTOF mass spectrometer.

General Procedure

A 15 mL sealed tube was charged with 1 (0.2 mmol) and 2 (0.3 mmol). Then H₂O (2 mL) was added and the resulting mixture was stirred at 80-100°C temperature. The reaction was monitored by TLC until starting material disappeared. The mixture was extracted with ethyl acetate (3×5 mL) and the extract dried with MgSO₄. The product 3 was purified by flash chromatography.
