1. General Experimental Methods

**General analytic methods.** $^1$H NMR spectra was recorded on 400 MHz spectrometers using CDCl$_3$ as solvent referenced to CDCl$_3$ (7.26 ppm). $^{13}$C NMR was recorded at 101 MHz in CDCl$_3$ (77.00 ppm). Multiplets were assigned as singlet, doublet, triplet, doublet of doublet, multiplet and broad singlet. FT-IR was recorded on a Bruker Tensor 27 FT-IR spectrophotometer with KBr pellets. Mass spectra were recorded on a Shimadzu GCMS-QP2010 equipped with a RTX-5MS capillary column at an ionization voltage of 70 eV. The data are given as mass units per charge (m/z). Electrospray ionization mass spectra (ESI-MS) were recorded with an Agilent 6520 Q-TOF mass spectrometer.

**Materials.** All starting materials were obtained from TCI, Aladdin or Alfa Aesar and used as received. Unless otherwise noted, carbon dioxide (99.99%). Propargylic amines and transition metal-substituted polyoxometalate-based ionic liquids were synthesized as previously described.

1.1 Procedure for the synthesis of transition metal substituted-polyoxometalate-based ionic liquids.

1.1.1 The preparation of K$_8$[$\alpha$-SiW$_{11}$O$_{39}$]$\cdot$13H$_2$O

\[
11 \text{WO}_4^{2-} + \text{SiO}_3^{2-} + 16 \text{H}^+ \xrightarrow{\text{pH 4.5 - 7}} [\alpha$-\text{SiW}_{11}\text{O}_{39}]^{8-} + 8 \text{H}_2\text{O}
\]

To a solution of Na$_2$WO$_4$$\cdot$2H$_2$O (32.99 g, 100 mmol) in H$_2$O (100 mL) was added Na$_2$SiO$_3$$\cdot$9H$_2$O (2.58 g, 9.1 mmol) in H$_2$O (15 mL) at 70-80 °C, with stirring and maintaining this temperature for 1 h. Then the mixture was adjusted the pH to 4.5 with 4 mol/L hydrochloric acid at 75 °C, and a small amount of insoluble substance was removed by filtration. After a half of water was removed in vacuum from the filtrate, saturated KCl solution was dropped to give the K$_8$[$\alpha$-SiW$_{11}$O$_{39}$]$\cdot$13H$_2$O as a white solid. Yield: 28.40 g (60%); IR (KBr, pellet): 3592, 3434, 3384, 1622, 1393, 1358, 999, 961, 896, 794, 729 cm$^{-1}$; (Ref. IR (KBr, pellet): 1000, 952, 885, 870 (sh), 797, 725, 625 (sh), 540, 520, 472 (sh), 430 (sh), 368, 332 cm$^{-1}$). The K$_8$[$\alpha$-SiW$_{11}$O$_{39}$]$\cdot$13H$_2$O was used for the next step without further purification, while as a catalyst, the crystal water was removed by heating at 120 °C for 4 h.

1.1.2 Typical procedures for the preparation of K$_8$[$\alpha$-SiW$_{11}$O$_{39}$Cu]$^2$

\[
[\alpha$-\text{SiW}_{11}\text{O}_{39}]^{8-} + \text{Cu}^{2+} \rightarrow [\alpha$-\text{SiW}_{11}\text{O}_{39}\text{Cu}]^{6-}
\]

To a stirred solution of 2.415 g (0.75 mmol) K$_8$[$\alpha$-SiW$_{11}$O$_{39}$]$\cdot$13H$_2$O in 10 mL of water was added in 0.1282 g (0.75 mmol) CuCl$_2$$\cdot$2H$_2$O. The solution was stirred for 1 h at room temperature
and then cooled to 0 °C. To the cold solution was added 30 mL cold methanol. The precipitated slightly blue solid $K_d[\alpha$-SiW$_{11}$O$_{39}$Cu(H$_2$O)]2H$_2$O was filtered off, washed with a 2:1 (v/v) cold methanol/water mixture. Yield: 1.62 g (67%); IR (KBr pellet): 3551, 3477, 3414, 1637, 1618, 1398, 1384, 1012, 960, 901, 798, 740 cm$^{-1}$. The water of $K_d[\alpha$-SiW$_{11}$O$_{39}$Cu(H$_2$O)]2H$_2$O was removed by heating at 120 °C for 4 h.

1.1.3 General procedures for the preparation of transition metal substituted-polyoxometalate-based ionic liquids $^{3,4}$

\[
[\alpha$-SiW$_{11}$O$_{39}]^8^+ + \text{M}^{2^+} + 6 \text{[C$_7$H$_{15}$]NO$_3^-$} \xrightarrow{\text{H}_2\text{O} / \text{toluene}} [\text{C$_7$H$_{15}$}[\alpha$-SiW$_{11}$O$_{39}]^8^+\text{M}]^8^+\
\]

25 mL of 20 mM aqueous $K_d[\alpha$-SiW$_{11}$O$_{39}$] solution and 50 mL of a 10 mM aqueous MCl$_2$ (M = Cu(II), Co(II), Fe(II), Mn(II), Zn(II), Ni(II)) solution were mixed and stirred for 15 min. Then the solution was treated with tetraheptylammonium bromide (2.47 g, 3 mmol) dissolved in 60 mL toluene. After the two phases were allowed to settle for 10 minutes, the organic layer was decanted and washed seven times with 20 mL water portions. The wet toluene was removed by heating to 40 °C under vacuum. Then 30 mL dry toluene was added and evaporated under reduced pressure to remove the traces of water. These transition metal substituted-polyoxometalate-based ionic liquids were characterized by FT-IR and Elemental Analysis.

[($^1$C$_7$H$_{15}$)_3N$_d$][\alpha$-SiW$_{11}$O$_{39}$Cu]: blue viscous liquid, IR (neat, KBr): 2955, 2927, 2856, 1638, 1618, 1383, 1265, 949, 898, 798, 739 cm$^{-1}$. Anal. Calcd for ($^1$C$_7$H$_{15}$)_3N$_d$[\alpha$-SiW$_{11}$O$_{39}$Cu] (MW = 5202): C 38.78, H 6.98, N 1.62. Found: C 38.19, H 6.80, N 1.66.

**1.2. Procedure for the synthesis of propargylic amines.**

1.2.1 Procedures for the preparation of 1a and 1b

\[
\text{Br} + \text{RNH}_2 \rightarrow \text{NHR}
\]

Propargyl bromide (3 mL, 27 mmol) was added to benzyl amine (18 mL, 162 mmol) or n-butylamine (16 mL, 162 mmol) over thirty minutes via addition funnel, and allowed to stir overnight. The resulting mixture was diluted in Et2O, and extracted with saturated aq. NaHCO3 and dried over MgSO4. The reaction mixture was concentrated and chromatographed, eluting with 9:1 hexanes/EtOAc, to afford the corresponding pale yellow liquid.

1.2.2 Procedures for the preparation of 1c - 1g

\[\text{Ph} + \text{RNH}_2 + \text{Cu} \rightarrow \text{PhNH}]

In a typical experiment, CuI (0.6 mmol) was charged in a Schlenk flask with a magnetic stirrer. The flask was sealed and flushed with N2 and then was charged with alkyne (2 mmol), aldehyde (2 mmol), and amine (2 mmol). The test tube was then placed in an oil bath of 75 °C and was allowed to stir overnight. The crude reaction mixture was purified by silica gel column chromatography to provide the desired propargylic amine.

**1.3 General procedure for the synthesis of 5-alkylideneoxazolidin-2-ones**

\[
\text{R}^1 + \text{R}^4 \text{NHR}^3 + \text{CO}_2 \rightarrow \text{R}^1 \text{R}^4 \text{N}^3 \text{R}^3 \text{R}^2
\]

\[[\text{C}_{10}\text{H}_{31}]\text{N}_{3}\alpha\text{SiW}_{11}\text{O}_{39}\text{Cu}] (130.0 mg, 0.025 mmol) and propargylic amine (1 mmol) were added to a 10 mL Schlenk tube equipped with a magnetic stir bar. The flask was capped and sealed. Then a gas-exchanging process was conducted using the “freeze-pump-thaw” method. The reaction mixture was stirred at 60 °C for 20 h under CO2 balloon (99.999%). Upon completion, product yield was determined by 1H NMR technique using 1,1,2,2-tetrachloroethane as an internal
standard. Then the reaction mixture was diluted with dichloromethane (2 mL). The organic phase was collected and then purified by column chromatography on silica gel using petroleum ether/ethyl acetate as an eluent to afford the desired product.

### 1.4 Exploration of the carbamate intermediate

```
  \[\text{HN-Bn} + \text{CO}_2 \xrightleftharpoons{K_4[\alpha-\text{SiW}_{11}O_{39}]} \rightarrow \text{H}_2\text{N}^+\text{Bn} + \text{N}^+\text{Bn}\]
```

Reaction conditions: Step 1: \(1\text{a} (0.2904 \text{ g}, 2 \text{ mmol}), K_4[\alpha-\text{SiW}_{11}O_{39}] (0.1494 \text{ g}, 0.05 \text{ mmol}), \text{CO}_2\) balloon, 0 °C, 10 min; Step 2: Carbamate A (0.3344 g, 1 mmol), \([\text{C}^6\text{H}_{15}_3\text{N}]_d[\alpha-\text{SiW}_{11}O_{39}\text{Cu}] (0.2600 \text{ g}, 0.05 \text{ mmol}), 60 \degree\text{C}, 20 \text{ h}, the yield was relative to \(1\text{a}\).

Scheme S1. Carbamate intermediate for the carboxylative cyclization reaction

Although \(K_4[\alpha-\text{SiW}_{11}O_{39}]\) were found to be ineffective, but it was also worth mentioning that \(K_4[\alpha-\text{SiW}_{11}O_{39}]\) allowed the reaction to produce the carbamate rather than 2-oxazolidinone \(2\text{a}\). To explore the reaction progress, a stepwise experiment was carried out (Scheme S1). At first, \(1\text{a}\) was reacted with \(\text{CO}_2\) balloon in the exist of \(K_4[\alpha-\text{SiW}_{11}O_{39}]\) (Step 1), and the white solid carbamate was afforded in only 10 min (Fig. S1). Then the carbamate was dealt with \([\text{C}^6\text{H}_{15}_3\text{N}]_d[\alpha-\text{SiW}_{11}O_{39}\text{Cu}]\) under no \(\text{CO}_2\) condition (Step 2). To our surprise, 50% yield of \(2\text{a}\) was obtained, which indicated that the carbamate probably is the intermediate of this carboxylative cyclization reaction. In fact, the carbamate could also be formed without any catalyst for at least 6 h. We thought that the formation of carbamate intermediate was accelerated due to the activation of propargylic amine and \(\text{CO}_2\) by \([\alpha-\text{SiW}_{11}O_{39}\text{Cu}]^6\). In addition, these results also indicated that \(\text{Cu(II)}\) played a key role in the subsequent intramolecular cyclization.
Fig. S1. $^{13}$C NMR and $^1$H NMR of carbamate in d-DMSO.
