Supplemental Information for:

Deformability based Sorting of Red Blood Cells Improves Diagnostic Sensitivity for Malaria Caused by Plasmodium Falciparum

Quan Guo, Simon P. Duffy, Kerryn Matthews, Xiaoyan Deng, Aline T. Santos, Emel Islamzada and Hongshen Ma

a Department of Mechanical Engineering, University of British Columbia, 2054-6250 Applied Science Lane, Vancouver, BC, Canada
b Department of Urologic Science, University of British Columbia, Vancouver, BC, Canada
c Vancouver Prostate Centre, Vancouver General Hospital, Vancouver, BC, Canada

Supplemental Figures and Tables:

Supplemental Figure 1. Schematic illustration of the microfluidic ratchet sorting device (A) and its equivalent hydrodynamic resistance model (B)

Supplemental Figure 2. Design principle of the microfluidic ratchet sorting device explained using the system hydrodynamic resistance modeling. (A) Equivalent hydrodynamic resistance model of the oscillation flow loop. (B) Equivalent hydrodynamic resistance model of the inlet-outlet flow loop.
Supplemental Figure 3. Giemsa stain light microscopy for determining pre-sorted sample parasitemia and Hoechst DNA stain of parasitized RBCs at outlets after sorting. Giemsa stain microscopy showing (A) uiRBCs as well as Pf-iRBCs at (B) early (0-24 hours) and (C) late stages (24–48 hours). (D) Hocheist 33342 stain of parasites within the infected RBCs, illuminating parasite DNA under fluorescence microscope.

Supplemental Table 1. Summary of hydrodynamic resistance of ratchet funnel
