General Experimental
All reactions involving organometallic or other moisture-sensitive reagents were carried out under a nitrogen atmosphere using standard vacuum line techniques and glassware that was oven dried and cooled under nitrogen before use. Commercial anhydrous solvents used in reactions and LCMS grade solvents were employed for work-up and chromatography. Water was purified using an Elix UV-10 system. All other reagents were used as supplied (analytical or LCMS grade) without prior purification. Parallel synthesis was carried out using a Radleys GreenHouse reactor. Parallel work-ups were carried out using a Radleys stacker and Isolute phase separation cartridges. Thin layer chromatography was performed on aluminium plates coated with 60 F_{254} silica. Plates were visualised using UV light (254 nm) or 1% aq. KMnO_4. \textit{R}_f values are quoted to the nearest 0.05. Flash column chromatography was performed either on Kieselgel 60 silica on a glass column, or on a Biotage SP4 automated flash column chromatography platform. Melting points were recorded on a Gallenkamp Hot Stage apparatus. Optical rotations were recorded on a Perkin-Elmer 241 polarimeter with a water-jacketed 10 cm cell. Specific rotations are reported in 10^{-1} \text{ deg cm}^2 \text{ g}^{-1} and concentrations in g/100 mL. IR spectra were recorded on a Bruker Tensor 27 FT-IR spectrometer; selected characteristic peaks are reported in cm^{-1}. NMR spectra were recorded on Bruker Avance spectrometers in the deuterated solvent stated. Spectra were recorded at room temperature unless otherwise stated. The field was locked by external referencing to the relevant deuteron resonance. Coupling constants (\textit{J}) are quoted in Hz and are recorded to the nearest 0.5 Hz. Identical proton coupling constants are averaged in each spectrum and reported to the nearest 0.5 Hz. When peak multiplicities are reported, the following abbreviations are used: s = singlet, d = doublet, t = triplet, m = multiplet, br = broadened, dd = doublet of doublets, dt = doublet of triplets. \textit{m/z} values are reported in Daltons. LRMS were recorded on a Waters LCT Premier, equipped with electrospray ionisation source and TOF analyser, acquiring in positive and negative ionisation modes or on an Agilent 6100 mass spectrometer operated with an electrospray ionisation source via flow injection analysis with an Agilent 1200 isocratic pump; data acquisition and processing was performed using Waters Masslynx 4.1 software or Agilent chemstation software. HRMS were run on either a Bruker MicroTOF internally calibrated with polyalanine, or a Micromass GCT instrument fitted with a
Scientific Glass Instruments BPX5 column (15 m × 0.25 mm) using amyl acetate as a lock mass. Elemental analyses were recorded by the elemental analysis service of the London Metropolitan University. Microwave experiments were carried out using a Biotage Initiator 8. Flash column chromatography was carried out using a Presearch Isco CombiFlash Companion using Presearch columns or on a Biotage SP4 using Biotage SNAP columns. LCMS $t_r$ are quoted to the nearest 0.1 min. LCMS were performed on the following systems: System A: WATERS sunfire C18 column (150 mm × 4.6 mm, 5 µm) using a linear gradient of solvent A (water + 0.01% CF$_3$CO$_2$H) and solvent B (acetonitrile + 0.01% CF$_3$CO$_2$H), eluting at a flow rate of 1 mL/min and monitoring at 254 nm: 0% B over 2 min, 0% B to 100% B over 16 min and 100% B over 2 min; System B: Merk Millipore Chromolith Performance RP-18e column (100 mm × 2 mm, 1.6 µm) using a linear gradient of solvent A (water + 0.01% CF$_3$CO$_2$H) and solvent B (acetonitrile + 0.01% CF$_3$CO$_2$H), eluting at a flow rate of 1 mL/min and monitoring at 254 nm: 2% B over 2 min, 2% B to 100% B over 8 min and 100% B over 1 min.

**4-Propoxypyridine**

Sodium metal (345 mg, 15.00 mmol) was added in portions to anhydrous $n$-PrOH (8 mL) at room temperature using a water bath to dissipate evolved heat. Once all sodium had dissolved, the resulting colourless solution was added drop-wise to a suspension of 4-chloropyridine hydrochloride (750 mg, 5.00 mmol) in $n$-PrOH (2 mL). The resultant suspension was heated at reflux for 16 h. The mixture was allowed to cool, neutralised by addition of 1 M aq. HCl, and then concentrated in vacuo. The material thus obtained was partitioned between EtOAc (10 mL) and water (10 mL). The phases were separated then the organic phase was washed with brine (10 mL) then dried over MgSO$_4$ and concentrated in vacuo. The crude material was purified by flash column chromatography on a silica column (24 g). The column was eluted with a gradient of EtOAc:c-hexane which was increased linearly from 0:100 to 80:20 over 12 CVs. The desired fractions were combined and evaporated to yield the product as a colourless oil (637 mg, 93%); $R_f$ 0.10 (EtOAc:c-hexane, 40:60); $\nu_{\text{max}}$ (neat) 3031 (C-H), 2967 (C-H), 2939 (C-H), 2880 (C-H); $^1$H NMR (400 MHz, CDCl$_3$) $\delta$ ppm 1.03 (t, $J=7.5$ Hz, 3 H, C(10)H$_3$), 1.81 (sxt, $J=7.5$ Hz, C(9)H$_2$), 3.95 (t, $J=6.5$ Hz, 2 H, C(8)H$_2$), 6.74 - 6.84 (m, 2 H, C(3)H + C(5)H), 8.31 - 8.50 (m, 2 H, C(2)H + C(6)H); $^{13}$C NMR (101 MHz, CDCl$_3$) $\delta$ ppm 10.3 (s, 1 C, C(10)), 22.2 (s, 1 C, C(9)), 69.3 (s, 1 C, C(8)), 110.2 (s, 2 C, C(3) + C(5)), 150.9 (s, 2 C, C(2) + C(6)), 165.0 (s, 1 C, C(4)); LRMS m/z (ESI$^+$) 138 [MH$^+$]; HRMS (ESI$^+$) found 138.0907, calculated for C$_8$H$_{12}$O$^+$ 138.0913; HPLC (System E) $t_r$ 1.1 min (>99%).

**Protein Expression and Purification**

cDNA encoding reported human bromodomains were cloned, expressed and purified as previously described.$^{5,6}$

**Differential Scanning Fluorimetry (DSF)**

Thermal melting experiments were carried out using an Mx3005p Real Time PCR machine (Stratagene). Proteins were buffered in 10 mM HEPES pH 7.5, 500 mM NaCl and assayed in a 96-well plate at a final concentration of 2 μM in 20 μL volume. Compounds were added at a final concentration of 10 μM. SYPRO Orange (Molecular Probes) was used as a fluorescence probe at a dilution of 1:1000. Excitation and emission
filters for the SYPRO-Orange dye were set to 465 nm and 590 nm, respectively. The temperature was raised with a step of 3 °C per minute from 25 °C to 96 °C and fluorescence readings were taken at each interval. Data was analysed as previously described.7

Isothermal Titration Calorimetry (ITC)
Experiments were carried out on a VP-ITC microcalorimeter (MicroCal™). All experiments were performed at 15 °C in 20 mM HEPES pH 7.5, 150 mM NaCl, 0.5 mM TCEP. BRD9 protein solution was buffer exchanged by gel filtration or dialysis into the ITC buffer. The titrations were conducted using an initial injection of 2 µl followed by 34 identical injections of 8 µl. The dilution heats were measured on separate experiments and were subtracted from the titration data. Thermodynamic parameters were calculated using $\Delta G = \Delta H - T\Delta S = -RT\ln K_B$, where $\Delta G$, $\Delta H$ and $\Delta S$ are the changes in free energy, enthalpy and entropy of binding respectively. In all cases a single binding site model was employed.

Crystallization
BRD9 construct (Uniprot identifier as BRD9 HUMAN Q9H8M2-1 fragment 14-134) was used for all crystallographic studies. Aliquots of the purified proteins were set up for crystallization using a mosquito® crystallization robot (TTP Labtech). Coarse screens were typically setup onto Greiner 3-well plates using three different drop ratios of precipitant to protein per condition (200 + 100 nL, 150 + 150 nL and 100 + 200 nL). All crystallizations were carried out using the sitting drop vapour diffusion method at 4°C. BRD9 crystals with compound 28 (2 mM final concentration) were obtained by mixing 200 nL of the protein (14 mg/ml) and 100 nL crystallization buffer (0.2 M NaNO3, 0.1 M BTProp pH 6.5, 20% PEG 3350, 10% EtGly).

Fluorescence Recovery After Photobleaching (FRAP) Assay
FRAP studies were performed using U2OS cells expressing a full-length BRD9 protein fused with an N-terminal eGFP as previously described.8 In short, six hours after transfection 2.5 μM SAHA and compound 28 were added. Imaging was carried out 24 hours after transfection.

Data Collection and Structure Solution
Crystals were cryo-protected using the well solution supplemented with additional 15% ethylene glycol and were flash frozen in liquid nitrogen. Data were collected at Diamond Light Source beamline I04-1 at a wavelength of 0.92 Å. Indexing and integration was carried out using XDS9 and scaling was performed with AIMLESS.10 Initial phases were calculated by molecular replacement with PHASER11 using an ensemble of known bromodomain models (PDB IDs 2OSS, 2OUO, 2GRC, 2OO1, 3DAI, 3D7C, 3DWY, 3G0L). Unique and initial solutions were improved in a total of 50 cycles of automated protein chain tracing starting from existing model and computed using ARP/wARP. Further manual building with COOT and refinement against maximum likelihood target using REFMACS. Thermal motions were analyzed using TLSMD12 and hydrogen atoms were included in late refinement cycles. PRODRG13 was used to generate compound coordinates and cif files. All model validations were carried out using MolProbity14 Data collection and refinement statistics are compiled in Supplemental Table 1. The models and structure factors have been deposited into the pdb.
