Molecular Docking

To investigate the binding patterns of the compounds in this series as well as facilitate the SAR analysis, compounds 7 and 19 were selected for the docking studies. The two inhibitors and the RSK2 NTKD (PDB code: 4NW6) were prepared respectively by the Ligprep module and Protein Preparation Wizard in Maestro (Schrödinger Inc, version 9.0). Glide in extra-precision (XP) mode was employed to do the molecular docking simulations with default parameter sets. The grid-enclosing box was centered on the ligand in 4NW6 and defined so as to include residues located within 20 Å around the ATP binding site, and a scaling factor of 1.0 was set to van der Waals (VDW) radii of those receptor atoms with the partial atomic charge less than 0.25. The top 10 docked poses of corresponding compounds ranked by GlideScore were remained for further analysis.

Synthetic Procedures and Characterizations of Compounds

Reagents and General Methods. All chemical reagents and solvents were purchased from commercial suppliers and used without further purification. Thin-layer
chromatography (TLC) was performed on silica gel plates. Column chromatography was performed using 200–300 mesh silica gel (Hailang, Qingdao). The $^1$H and $^{13}$C NMR spectra were recorded on a Bruker AV-400 spectrometer with chemical shifts expressed in parts per million (ppm) units (in DMSO-$d_6$ or CDCl$_3$, using Me$_4$Si as the internal standard). The low or high resolution of ESI-MS was measured at the Institute of Fine Chemistry of ECUST. Melting points were determined using an WRS-1B digital melting point apparatus.

2-((phenylamino)methyl)isoindoline-1,3-dione (1)

To a solution of phthalimide (300 mg, 2.04 mmol) in 80% ethanol (3.5 mL) was added formaldehyde (0.2 mL, 2.65 mmol). The reaction mixture was stirred at reflux until all of the phthalimide had dissolved. Next a solution of phenylamine (209 mg, 2.24 mmol) dissolved in 80% ethanol (1.5 mL) was added. The reaction mixture was stirred at reflux for 3 h. After cooling overnight the precipitate was filtered and washed with cold ethanol. The crude product was purified by flash silica gel chromatography (petroleum ether/ethylacetate = 5:1, v/v) to obtain the title product as a pale yellow solid (320 mg, yield 62%). mp 145.8-146.3 °C. $^1$H NMR (400 MHz, DMSO-$d_6$): $\delta$ 7.88-7.83 (m, 4H), 7.08 (t, $J = 8.0$ Hz, 2H), 6.83 (d, $J = 8.0$ Hz, 2H), 6.63-6.57 (m, 2H), 5.01 (d, $J = 5.2$ Hz, 2H). $^{13}$C NMR (100 MHz, DMSO-$d_6$): $\delta$ 168.46, 146.57, 135.10, 131.87, 129.41, 123.67, 117.65, 112.93, 47.47. **In vitro kinase inhibition assay**

The kinase inhibition assay was performed as previously reported. The ADP Quest assay (DiscoveRx) was conducted in 96-well flat-bottom plates in 40 μL reaction volume according to the manufacturer’s instructions. 20 ng of the kinase (Millipore) in 30 μL of assay buffer (15 mM of HEPES, pH 7.4, 20 mM of NaCl, 1 mM of EGTA, 0.02% of Tween 20, 10 mM of MgCl$_2$, and 0.1 mg/mL BGG) containing 25 μM of S6 peptide (AKRRRLSSLRA, Anaspec) was incubated for 20 minutes at room temperature with indicated concentrations of the compounds to be tested. Reactions were started by the addition of 10 μL of ATP to a final concentration of 10 μM, after 60 min at room temperature, 20 μL of ADP reagent A and 40 μL of ADP reagent B were added to terminate the reactions. Ro31-8220 was used as the positive control compound. Solutions of tested compound were prepared from DMSO stock and diluted with assay buffer for the inhibition assay. The amount of ADP produced was detected by the fluorescence signal, as a result of the kinase activities were recorded by Synergy 2 multimode microplate reader (BioTek) at an excitation wave length of 530 nm and an emission wavelength of 590 nm at 30 min.
after the addition of ADP reagent B. All experiments were repeated at least three times. The data were analyzed using GraphPad Prism version 4.0 to determine the IC₅₀ values.
