Table of Contents

1. Geometry of molecules and complexes
2. Transmission coefficient as a function of energy for molecule 1 and 2, a comparison of using different counter ions BF\textsubscript{4} & PF\textsubscript{6}
3. Calculated thermopower as a function of temperature for molecule 1 and 2
4. Calculated thermopower for complexations

1. Geometries of molecules and complexes

The DFT code (SIESTA) was used to obtain fully relaxed geometries of the isolated molecules 1 and 2, and their complexes with tetrathiafulvalene (TTF), tetracyanoethylene (TCNE), alkali cations and their counterions BF\textsubscript{4} and PF\textsubscript{6}. Complexes were formed by adding an alkali cation and its counter ion to molecule 1 or 2 (single cation). In the same way, the second cation and its counter ion added to configuration to form sandwich case. In both cases (single and double cation), TTF or TCNE has added to the complexes to form the final configuration (for instance, AQ 15C5 + (PF\textsubscript{6} + Na\textsuperscript{+}) + TCNE).
Figure S1: Examples of fully relaxed geometries. The first row shows isolated molecules of TTF, TCNE, BF₄ and PF₆. The second row shows a complex of 2 (i.e., AQ diaza-15C5) with (PF₆⁻ + K⁺). The third row shows a complex 2 with two (PF₆⁻ + K⁺)s. The fourth row shows a complex of 1 (AQ 15C5) with TTF and (PF₆⁻ + Na⁺).

2. Transmission coefficients as a function of energy

The figures below show the transmission coefficient T(E) calculated for the bare molecule, bare molecule + single alkali cation and bare molecule + two alkali cations, for three different cations: Li⁺, Na⁺ and K⁺, for both molecules 1 and 2.
Figure S2 | Zero bias transmission coefficient, $T(E)$ of 2 (left column) and 1 (right column) with a single cation and double cations, (a) Li$^+$, (b) Na$^+$ and (c) K$^+$. The bottom panel shows $T(E)$ obtained using different counter ions BF$_4$ and PF$_6$ with (NC + Li$^+$)

3. Calculated thermopower as a function of temperature

Thermopower calculated from figure S2 using eq.2, for single and double cations of Li$^+$, Na$^+$ and K$^+$.

![Graphs showing the thermopower as a function of temperature for different cations.](image-url)

Figure S3 | Thermopowers from Figure S2. left (2), right (1)
4. Calculated thermopower for complexes with various dopants and cations

Thermopower calculated using eq.2 for two dopants TTF and TCNE with single and double alkali Li⁺, Na⁺ and K⁺. Left figures, NC + TTF yield the highest S and the bare is the lowest, complexes varying between them. Similar behaviour at high T, but at low T some complexes are as good as OC + TTF.

**Figure S4** | Thermopower for bare molecule and with TTF and TCNE + three different alkalis for 2 left and 1 right.
