Part I. Experimental details of the Fe-Mn@CNTs IM

The multi-walled CNTs were purchased from Qinghuangdao Tai Chi Ring Nano Product Co. Ltd (China). Before use, the CNTs were refluxed in 80\% HNO\textsubscript{3} aqueous solution at 140 °C for 6 h, washed with deionized water to remove residual HCl, and then dried at 80 °C overnight.

The Fe-Mn@CNTs IM was prepared by an impregnation method for comparison. In a typical synthesis, according to the obtained molar percentage of Fe@Mn@CNTs catalysts by the XPS and the weight percentage by TGA analysis, 1.30 mmol of Manganese (II) nitrate hexahydrate, 1.88 mmol of Iron(III) nitrate nonahydrate and 200 mg of CNTs were dispersed in 40 ml deionized water with ultrasonic treatment for 30 min. After that, the mixed solution was dried at 60 °C for 20 h under stirring. Finally, the products were calcined in N\textsubscript{2} stream at 450 °C for 4 h with a ramping rate of 2 °C/min.
