General information

All the commercially available reagents were used as received. IR Spectra were recorded on a SHIMADZU FTIR-8400 instrument. NMR spectra were recorded on Advance DPX 300 MHz FT-NMR spectrometer using tetramethylsilane (TMS) as an internal standard. Mass spectra were recorded on ESQUIRE 3000 Mass spectrometer. All the experiments were monitored by thin layer chromatography (TLC). TLC was performed on pre-coated silica gel plates (Merck). After elution, plate was visualized under UV illumination at 254 nm for UV active materials. Further visualization was achieved by staining KMnO4 warming in a hot air oven. Column chromatography was performed on silica gel (100-200 mesh, Merck) using ethyl acetate: hexane as eluent.

Experimental data

General procedure for the synthesis of pyrano[2,3-d]pyrimidines via tandem conjugative alkynylation/6-endo cyclization process (4a-4w):

To a mixture of barbituric acid 1 (1 mmol), aldehyde 2 (1 mmol), terminal alkyne 3 (1.2 mmol) in DCE (8ml), add 1.3 equivalents of KOtBu and 10 mol% Cu(OTf)2. Then, the mixture was stirred at 110 ºC in DCE till the complete conversion of conjugative addition product takes place. After completion of reaction as indicated by TLC, the crude mixture was cooled down to room temperature and the solvent was distilled off under reduced pressure. The mixture was then quenched with water, and extracted with ethyl acetate (3×15ml). The combined organic extracts were dried over anhydrous Na2SO4, filtered, and concentrated in vacuo. The residue was purified by column chromatography by using ethyl acetate and hexane as eluents to furnish the desired products (4a-4w).
Control experiments:

Procedure for cyclization of conjugative addition product 4a':

Conjugative addition product 4a' (0.5 mmol), KOtBu (0.6 mmol) and Cu(OTf)$_2$ (5 mol%) were added into a 50 ml round bottomed flask containing DCE (5 ml). Then, the mixture was stirred at 110 °C in DCE for 2 h. After completion of reaction as indicated by TLC, the crude mixture was cooled down to room temperature and the solvent was distilled off under reduced pressure. The mixture was then quenched with water, and extracted with ethyl acetate (3×15ml). The combined organic extracts were dried over anhydrous Na$_2$SO$_4$, filtered, and concentrated in vacuo. The residue was purified by column chromatography by using ethyl acetate and hexane as eluents to furnish the desired product 4a in 81% yield as yellow solid.

Procedure for synthesis of compound 4x via two component reaction strategy:

To a mixture of Knoevenagel condensation product i.e. barbituric acid derived organic acceptor 1a' (1 mmol), 1-ethynyl-4-pentyl benzene 3a (1.2 mmol), in DCE (5ml), add 1.3
equivalents of KO\textsubscript{Bu} and 10 mol\% Cu(OTf)\textsubscript{2}. Then, the mixture was stirred at 110 °C in DCE till for 12 h. After completion of reaction as indicated by TLC, the crude mixture was cooled down to room temperature and the solvent was distilled off under reduced pressure. The mixture was then quenched with water, and extracted with ethyl acetate (3×15ml). The combined organic extracts were dried over anhydrous Na\textsubscript{2}SO\textsubscript{4}, filtered, and concentrated in vacuo. The residue was purified by column chromatography by using ethyl acetate and hexane as eluents. Cyclization product 4\textsubscript{x} was isolated as yellow solid in 61\% yield and conjugative addition product 4\textsubscript{x'} in 8\% yield.
