1. General information

Hexane, ethyl acetate and dichloromethane were dried and distilled using standard methods. Molecular sieves were dried in the oven at 300 °C for 12 hours. Other chemicals and solvents, if not otherwise cited, are commercially available and were used without further purification. Column chromatography was performed using normal silica gel with particle size from 0.006 to 0.043 mm.

NMR measurements were carried out with Bruker AVANCE 250 II (built 2006), Bruker AVANCE 300 III (built 2007) and Bruker AVANCE 500 (built 2001) spectrometers. NMR peaks were adjusted according to the standard $^1$H- and $^{13}$C-NMR signals of CDCl$_3$ at 7.260 and 77.160 ppm, respectively. For multiplicity description, abbreviations s (singlet), d (doublet), t (triplet), q (quartet), m (multiplet) and dd (doublet doublet) were used.

IR measurements were recorded on a Nicolet 380 FT-IR spectrometer using ATR sampling technique for both liquids and solids. To report peaks, abbreviations w (weak), m (medium) and s (strong) were used.

GC/MS measurements were conducted on a Finnigan MAT 95-XP device with HP-5 capillary column using helium carrier gas and using electron ionization (EI) scan technique.

Yield calculation via $^1$H-NMR technique was carried out using dimethyl sulfone as internal standard.

2. General synthetic procedure

2.1. Imine synthesis

A mixture of ketone (10.0 mmol), amine (10.0 mmol), NaHCO$_3$ (4.20 g) and molecular sieve 4Å (8.00 g) in dried toluene (10.0 ml) in a flask was heated to 80 °C or refluxed for 12 hours overnight. The reaction was controlled on the next day for completion by TLC. After completion, the mixture was taken up in dichloromethane and filtered through zeolite. The solvents were evaporated under reduced pressure. The products were purified by recrystallization in heptane/ethyl acetate mixture or by Kugelrohr distillation under reduced pressure.

2.2. General procedure for 4-azaindole synthesis

2-Bromo-3-chloropyridine 1b (0.3 mmol), imine 2a – 2o (0.33 mmol), Pd(OAc)$_2$ (0.018 mmol), PCy$_3$ (0.036 mmol) and NaOrBu (0.84 mmol) were put into a dried pressure tube. The tube was then evacuated and backfilled three times with argon. Dioxane (6 ml) was added to
the tube, evacuated and backfilled three times again. The reaction mixture was sealed and stirred in 10 minutes under room temperature and was subsequently heated at 105 °C for 16 – 48 hours. The reaction was controlled by TLC for completion. After that, it was cooled down to room temperature, taken up in dichloromethane and filtered through zeolite. The solvent was removed by evaporation \textit{in vacuo}. The residue was put into column chromatography using the elute mixture heptane/ethyl acetate.

2.3. General procedure for 7-azaindole synthesis

2-Bromo-3-chloropyridine \textbf{1c} (0.3 mmol), imine \textbf{2a} – \textbf{2o} (0.33 mmol), Pd(OAc)$_2$ (0.018 mmol), PCy$_3$ (0.036 mmol) and NaOEtBu (0.84 mmol) were put into a dried pressure tube. The tube was then evacuated and backfilled with argon. Dioxane (6 ml) was added to the tube, evacuated and backfilled again. The reaction mixture was sealed and stirred in 10 minutes under room temperature and subsequently 16 – 48 hours at 105 °C. The reaction was controlled by TLC for completion. After that, it was cooled down to room temperature, taken up in dichloromethane and filtered through zeolite. The solvent was removed by evaporation \textit{in vacuo}. The residue was put into column chromatography using the elute mixture heptane/ethyl acetate.
