1. General Remarks
Reagents and solvents: Commercially available reagents were used without any further purification. All organic solvents were of reagent grade quality. The dry 1, 4-dioxane was distilled from sodium/benzophenone.

Chromatography: Flash column chromatography was performed using Silicycle silica gel (200-300 mesh). Analytical thin-layer chromatography (TLC) was performed on 0.2 mm coated silica gel plates (HSGF 254) and visualized using a UV lamp (254 nm or 365 nm).

Nuclear Magnetic Resonance Spectroscopy: $^1$H NMR was recorded on magnet system 400’54 ascend purchased from Bruker Biospin AG. $^1$H NMR spectra chemical shifts (δ) are reported in parts per million (ppm) referenced to TMS (0ppm). Data are reported as follows: chemical shift, multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, dd = doublet of doublets, dt = doublet of triplets, ddt = doublet of doublet of triplets, dtd = doublet of triplet of doublets, m = multiplet, br = broad), coupling constant (J) in Hertz (Hz), and integration.

![Scheme S1: Proposed mechanism of H$_2$O$_2$/Br$^-$/H$^+$](image)

Initially, Br$^-$ was oxidized to form the hypobromous acid in the presence of acid and hydrogen peroxide. The generated hypobromous acid subsequently reacted with the corresponding hydroxyl group to form the hypobromite intermediate A, which yielded the corresponding carbonyl compounds via α-hydrogen elimination. Brønsted acid and Br$^-$ were reformatted to maintain the system circularly. [1-2]

$^a$reaction condition: 1a (1 mmol), AIBN (0.05 mmol), NaBr (3 mmol), solvent (3 mL), T (°C), under O$_2$ (O$_2$ balloon). $^b$yield: isolated yield.

4, General experimental procedure

The specific benzylic alcohols (1 mmol, 1.0 eq) and sodium bromide (3 mmol, 3 eq) were dissolved in dioxane (3 mL), then AIBN (0.05 mmol, 0.05 eq) was added to the reaction mixture and stirred for a certain time in a preheated oil batch at 70 °C under O$_2$ atmosphere (O$_2$ balloon). The reaction mixtures were diluted with ethyl acetate and washed with brine and water. The separated organic layers were dried over by anhydrous Na$_2$SO$_4$ and filtered. The filtrate was concentrated under reduced pressure and the residue was chromatographed on silica gel using hexane/ethyl acetate to afford the desired product.
