EXPERIMENTAL SECTION

Materials. All reagents were purchased from Aldrich, Solarmer or Alfa-Aesar and used without further purification. (2,5-diethylhexyl-3,6-bis(5-bromothien-2-yl)pyrrolo[3,4-c]-pyrrole-1,4-dione) was synthesized according to the reported procedure in the literature. Moisture sensitive reactions were conducted in the presence of N$_2$ atmosphere. The other materials were common chemicals used as received. THF was dried over Na/benzophenone ketyl and freshly distilled prior to use. $^1$H and $^{13}$C NMR spectra were recorded on a Varian Mercury Plus 300 MHz spectrometer in CDCl$_3$ using tetramethylsilane as an internal reference. The chemical shifts were accounted in ppm related to the singlet of CDCl$_3$ at 7.26 and 77 ppm for $^1$H and $^{13}$C NMR, respectively. The UV-visible absorption spectra were recorded on a JASCO V-570 spectrophotometer. Polymerization was performed in a CEM-focused microwave TM synthesis system. The weight-average molecular weight ($M_w$), number-average molecular weight ($M_n$) and PDI of the polymers were determined by GPC using a PL gel 5 µm MLXED-C column on an Agilent 1100 series liquid chromatography system with THF as an eluent and calibration with polystyrene standards. Thermal analysis was carried out on a Mettler Toledo TGA/SDTA 851e, DSC 822e analyzer under N$_2$ atmosphere at a heating rate of 10 °C/min. The CV analysis was carried out in a 0.1 M solution of tetrabutylammonium perchlorate in anhydrous acetonitrile at a scan rate of 100 mV/s using a CHI 600C potentiostat (CH Instruments), a three-electrode cell with platinum electrode as the working electrode, Ag/AgCl as the reference electrode, and a platinum (Pt) wire as the counter electrode. Polymer thin films were coated on the Pt electrode and dried before the experiment. X-ray diffraction measurements were carried out with Cu Ka ($\lambda=1.54$ Å) in a diffractometer (X'pert PRO MRD, Philips) equipped with Göbel mirror. Incidence angle was fixed at 0.17°, the angle between the critical angle of the polymer and the
substrate. The detector was scanned the angle (2Θ) from 10° to 90°, similar geometry as in the grazing incidence wide angle scattering.

**Fabrication and Characterization of BHJ IOSCs.** For the IOSCs, the device configuration is ITO/ZnO (60 nm)/polymer:PC$_71$BM (100 nm) or polymer:PC$_71$BM (100 nm)+3%DIO/Methanol treatment/PEDOT:PSS (10 nm)/Ag (100 nm). The ITO-coated glass substrates used for fabrication were ultrasonically cleaned with detergent, water, acetone, and isopropyl alcohol. The ZnO precursor was prepared by dissolving zinc acetate dihydrate (Zn(CH$_3$COO)$_2$·2H$_2$O, 1.64 g) and ethanolamine (NH$_2$CH$_2$CH$_2$OH, 0.5 g) in 10g of 2-methoxyethanol, under vigorous stirring for 20 min for the hydrolysis reaction in air. The ZnO layer was spin cast from the precursor solution on top of the clean ITO-coated glass substrate, and annealed at 150 °C for 10 min in air. The photoactive layer of polymer:PC$_71$BM was cast from a solution with the ratio of 1:0.7, 1:1.5, and 1:2 that was dissolved in 1 mL of CB and then spin coated at a rate of 1200 rpm for 30 s in a N$_2$ glove box. After drying in a vacuum, various solvent treatments were carried out. Finally, ~10 nm PEDOT:PSS (CLEVIOS PVP AI 4083):IPA (1:10 v/v%) and ~100 nm Ag layers were deposited on the photoactive layer. The top metal electrode area, comprising the active area of the solar cell, was 0.38 cm$^2$. The $J$-$V$ characteristics of the devices were measured using a Keithley 2400 source measure unit under a calibrated AM 1.5G solar simulator (Oriel® Sol3A™ Class AAA solar simulator, models 94043A) at 100 mW/cm$^2$. The intensity of sunlight illumination was calibrated using a standard Si photodiode detector with a KG-5 filter. The IPCE measurement system (Oriel IQE-200) was composed of a 250 W quartz-tungsten-halogen lamp as the light source, and a monochromator, optical chopper, lock-in amplifier, and calibrated silicon photodetector. All IOSCs data were confirmed for more than 10 iterations under the same
condition. While measuring the $J$-$V$ curves for IOCs, a black mask was used and only the effective area of the cell was exposed to light irradiation.

**Hole and electron mobility.** The hole mobility of bare polymers were calculated by fabricating the device structure of ITO/PEDOT:PSS/polymer/MoO$_3$/Al. The hole and electron mobility were evaluated from the $J$-$V$ characteristics of single charge carrier devices and the results were subsequently fit using the SCLC method. The hole-only devices for BHJ composites were fabricated as follows: ITO/PEDOT:PSS(40 nm)/polymer:PC$_{71}$BM (100 nm) or polymer:PC$_{71}$BM (100 nm)+ 3%DIO or polymer:PC$_{71}$BM (100 nm)+ 3%DIO (methanol treatment)/PEDOT:PSS (50 nm)/Al (100 nm). The electron-only devices were fabricated using the following device configuration: ITO/ZnO (60 nm)/polymer:PC$_{71}$BM (100 nm) or polymer:PC$_{71}$BM (100 nm)+ 3%DIO or polymer:PC$_{71}$BM (100 nm)+ 3%DIO (methanol treatment)/LiF/Al (150 nm). The mobility was determined by fitting the dark $J$-$V$ curve into the SCLC model, based on the equation described by the Mott-Gurney law.

$$J = \frac{9}{8}\varepsilon_r\varepsilon_0\mu(V^2/L^3)$$

Where $\varepsilon_r$ is the dielectric constant ($\varepsilon_r=3$), $\varepsilon_0$ the permittivity of free space, $L$ the thickness of the photoactive layer, $\mu$ the charge mobility and $V$ the voltage drop across the device.

**Impedance Spectroscopy.** The impedance response was measured over the range of 1 Hz to 1MHz with an oscillation amplitude of 15 mV (Bio-Logic VMP-3). The experimental data were simulated using commercial Z-view software to estimate the values for each component of the corresponding equivalent circuits.
((3-Bromophenyl)ethynyl)trimethylsilane (1). To a 50 mL flask was added the 1,3-dibromobenzene (2 g, 8.41 mmol), bis (triphenylphosphine)palladium (II) dichloride (0.294 g, 5 mol %), and copper (I) iodide (0.079 g, 5 mol %). 30 mL of tetrahydrofuran (THF) was added followed by Et₃N (10 mL). Then, trimethylsilylacetylene (1.198 mL, 8.41 mmol) was added at room temperature and further stirred for 3 h. After the reaction was completed, solvent was removed under pressure and the resulting residue was extracted with methylene chloride (MC), dried over anhydrous Na₂SO₄ and the solvent was evaporated to afford the crude compound as brown oil, which was then purified by column chromatography on silica gel using hexane as an eluent to obtain a colorless liquid (1.6 g, 72 %). ¹H NMR (300 MHz, CDCl₃): δ (ppm) 7.64 (d, 1H), 7.42 (m, 2H), 7.16 (m, 1H), 0.23 (s, 9H). ¹³C NMR (300 MHz, CDCl₃): δ (ppm) 133.74, 132.46, 130.40, 126.12, 125.74, 103.68, 100.12, 0.00.

((4’-(2-Ethylhexyloxy)biphenyl-3-yl)ethynyl)trimethylsilane (2). 2 M aqueous Na₂CO₃ (10 mL) was added to a mixture of ((3-bromophenyl)ethynyl)trimethylsilane (3 g, 11.8 mmol), 2-(4-(2-ethylhexyloxy)phenyl)-4,4,5,5-tetramethyl-1,3,2-dioxaborolane (4.58 g, 14.2 mmol), and tetrakis(triphenylphosphine)palladium (0.136 g, 0.03 mmol) dissolved in 24 mL of toluene. The mixture was refluxed for 12 h under N₂ atmosphere. The solvent was removed under reduced pressure and the residue was purified by column chromatography on silica gel using ethylacetate (EA)/hexane (4:1) as the eluent to produce a colorless liquid. Yield: 60%. ¹H NMR (300 MHz, CDCl₃): δ (ppm) 7.66 (s, 1H), 7.48 (m, 3H), 7.34 (m, 2H), 6.96 (d, 2H), 3.84 (d, 2H), 1.64-1.78 (m, 1H), 1.22-1.54 (m, 8H), 0.84 (m, 6H), 0.26 (s, 9H). ¹³C NMR (300 MHz, CDCl₃): δ (ppm) 158.84, 141.42, 133.16, 131.79, 129.78, 127.31, 126.52, 125.81, 123.32, 115.37, 105.89, 94.32, 72.14, 39.84, 31.17, 29.82, 23.21, 22.84, 14.13, 11.84, 0.00.
4′-(2-Ethylhexyloxy)-3-ethynylbiphenyl [BPA(H)]. (4′-(2-Ethylhexyloxy)biphenyl-3-yl)ethynyltrimethylsilane (1.2 g, 3.12 mmol) was dissolved in 20 mL of MC and a solution of 1.4 g of potassium hydroxide dissolved in 25 mL of methanol was added. The reaction mixture was stirred at room temperature for 2 h before quenching with water (150 mL) and extracted with MC (80 mL), dried over anhydrous Na₂SO₄ and the solvent was evaporated to afford the crude compound as yellow oil, which was then purified by column chromatography on silica gel using EA/hexane (3:1) as an eluent to obtain a colorless liquid (0.9 g, 83%). ¹H NMR (300 MHz, CDCl₃): δ (ppm) 7.68 (s, 1H), 7.52 (t, 3H), 7.38 (m, 2H), 6.94 (d, 2H), 3.92 (d, 2H), 3.08 (s, 1H), 1.74 (m, 1H), 1.38 (m, 8H), 0.92 (m, 6H). ¹³C NMR (300 MHz, CDCl₃): δ (ppm) 158.84, 141.42, 133.16, 131.79, 129.78, 127.31, 126.52, 125.81, 123.32, 115.37, 84.31, 72.14, 39.84, 31.17, 29.82, 23.21, 22.84, 14.13, 11.84.

4,8-Bis(4′-(2-ethylhexyloxy)-3-ethynylbiphenyl)benzo[1,2-b:4,5-b′]dithiophene (3). n-BuLi (2.5 M, 1.1 mL) was added dropwise to a solution of 4′-(2-ethylhexyloxy)-3-ethynylbiphenyl (0.7 g, 2.9 mmol) in THF (25 mL) at 0 °C under N₂ atmosphere. The temperature of the reaction mixture was raised to 50 °C and stirred for 1.5 h. 4,8-Dihydrobenzo[1,2-b:4,5-b′]dithiophene-4,8-dione (0.3 g, 1.3 mmol) was added directly to the reaction mixture at 50 °C, which was then stirred for 2 h at the same temperature. Subsequently, the reaction mixture was cooled to room temperature and tin(II) chloride dihydrate (1.9 g, 19.75 mmol) in 15% HCl (20 mL) was added and further stirred for 1.5 h, before being poured into ice water. The reaction mixture was extracted with diethyl ether, the resultant organic layer was dried over anhydrous Na₂SO₄ and the solvent was evaporated to afford the crude compound as brown oil, which was then purified by column chromatography on silica gel using hexane as an eluent to obtain a yellow solid (0.5 g, 45 %). ¹H NMR (300 MHz, CDCl₃): δ (ppm) 7.84 (s, 2H), 7.74 (d, 2H),
7.52–7.64 (m, 10H), 7.48 (d, 2H), 7.02 (d, 4H), 3.84 (d, 4H), 1.74 (m, 2H), 1.32–1.48 (m, 14H),
0.78–0.98 (m, 12H). $^{13}$C NMR (300 MHz, CDCl$_3$): $\delta$ (ppm) 158.84, 141.84, 140.42, 138.74,
132.14, 129.76, 126.21, 125.79, 123.52, 115.43, 115.21, 112.26, 99.89, 86.24, 71.31, 39.84,
31.17, 29.82, 23.21, 22.84, 14.13, 11.84.

2,6-(Trimethyltin)-4,8-bis(4'-(2-ethylhexyloxy)-3-ethynylbiphenyl)benzo[1,2-b:4,5-
b']dithiophene [BDTBPA(H)]. A solution of compound 4 (0.5 g, 0.6 mmol) in THF (30 mL)
was placed in a 50 mL flask, which was flushed with N$_2$ and the solution was cooled to -78 °C
using dry ice/acetone. To the cooled solution, tert-BuLi (1.7 M, 0.73 mL) was added slowly and
stirred for another 30 min at -78 °C and trimethyltin chloride (0.25 g, 1.2 mmol) was directly
added as a solid. The solution was slowly warmed to room temperature and stirred overnight.
Aqueous sodium carbonate (20 mL) was added slowly to the solution and extracted with MC (30
mL). The resultant organic layer was dried over anhydrous Na$_2$SO$_4$ and the solvent was
evaporated to afford a yellow residue, which was recrystallized from ethanol to obtain a yellow
solid (0.45 g, 64%). $^1$H NMR (300 MHz, CDCl$_3$): $\delta$ (ppm) 7.86 (s, 2H), 7.76 (d, 2H), 7.54–7.66
(m, 8H), 7.44–7.50 (m, 2H), 6.98–7.04 (d, 4H), 3.92 (d, 4H), 1.72-1.78 (m, 2H), 1.28-1.52 (m,
16H), 0.82-0.98 (m, 12H), 0.39-0.58 (m, 18H). $^{13}$C NMR (300 MHz, CDCl$_3$): $\delta$ (ppm) 159.294,
144.77, 143.68, 141.26, 139.08, 132.54, 130.89, 130.05, 129.97, 128.87, 128.19, 127.15, 123.46,
114.90, 98.63, 86.28, 70.57, 39.38, 30.54, 29.10, 23.86, 23.09, 14.15, 11.15, -8.18. Anal. Calcd
for C$_{60}$H$_{70}$O$_2$S$_2$Sn$_2$: C, 64.07; H, 6.27; O, 2.84; S, 5.70; Sn, 21.11. Found: C, 63.92; H, 6.38.

4'-(2-Ethylhexyloxy)-2,4-difluorobiphenyl (4). 2 M aqueous Na$_2$CO$_3$ (15 mL) were added to
a mixture of 1-bromo-4-(2-ethylhexyloxy)benzene (3 g, 10 mmol), 2,4-difluorophenylboronic
acid (2.15 g, 13 mmol), and tetrakis(triphenylphosphine)palladium (0.607 g, 0.1 mmol) dissolved
in toluene (24 mL) and ethanol (12 mL). The mixture was refluxed for 12 h under N$_2$
atmosphere. After cooling to room temperature, the mixture was extracted with MC and dried over anhydrous Na$_2$SO$_4$. The solvent was removed under reduced pressure and the residue was purified by column chromatography on silica gel using EA/hexane (4:1) as an eluent to produce a colorless liquid (3.2 g, 50%). $^1$H NMR (300 MHz, CDCl$_3$): $\delta$ (ppm) 7.32–7.46 (m, 3H), 6.82–6.98 (m, 4H), 3.92 (d, 2H), 1.72–1.80 (m, 1H), 1.22–1.52 (m, 8H), 0.82–0.98 (m, 6H). $^{13}$C NMR (300 MHz, CDCl$_3$): $\delta$ (ppm) 162.89, 161.47, 160.02, 159.28, 158.74, 132.93, 130.76, 129.17, 127.73, 124.32, 114.82, 112.13, 104.98, 70.73, 38.94, 31.13, 28.95, 22.71, 14.15, 11.15.

4'-(2-Ethylhexyloxy)-2,4-difluoro-3-iodobiphenyl (5). A solution of compound 6 (2 g, 6.2 mmol) in THF (30 mL) was placed in a 50 mL flask, flushed with N$_2$ and cooled to -78 °C using dry ice/acetone. LDA (2 M in THF/pentane, 3.77 mL) was added slowly, the solution was stirred for another 30 min at -78 °C and iodine (1.75 g, 6.9 mmol) in 20 mL of THF was added. The solution was slowly warmed to room temperature and stirred overnight. The reaction was quenched with water, extracted with EA. The resultant organic layer was dried over anhydrous Na$_2$SO$_4$ and the solvent was evaporated to afford a yellow residue, which was purified by column chromatography on silica gel using EA/hexane (1:1) as an eluent to produce a colorless liquid (2.1 g, 70%). $^1$H NMR (300 MHz, CDCl$_3$): $\delta$ (ppm) 7.28–7.44 (m, 3H), 6.84–7.02 (m, 3H), 3.84 (d, 2H), 1.72–1.80 (m, 1H), 1.22–1.52 (m, 8H), 0.80–0.98 (m, 6H). $^{13}$C NMR (300 MHz, CDCl$_3$): $\delta$ (ppm) 162.89, 161.47, 160.02, 159.28, 158.74, 132.93, 130.76, 129.17, 127.73, 124.32, 114.82, 112.13, 70.73, 38.94, 31.13, 28.95, 22.71, 14.15, 11.15.

((4'-(2-Ethylhexyloxy)-2,4-difluorobiphenyl-3-yl)ethynyl)trimethylsilane (6). To a 100 mL flask was added the compound 7 (2 g, 4.51 mmol), bis (triphenylphosphine)palladium (II) dichloride (0.105 g, 5 mol %), and copper (I) iodide (0.025 g, 5 mol %). The vessel was then sealed with a rubber septum, evacuated and backfilled with argon three times. 25 mL of THF
was added followed by 10 mL of Et$_3$N. Then, trimethylsilylacetylene (0.763 mL, 5.4 mmol) was added at room temperature and further stirred for 3 h. After the reaction was completed, solvent was removed under pressure and the resulting residue was extracted with MC, dried over anhydrous Na$_2$SO$_4$ and the solvent was evaporated to afford the crude compound as brown oil, which was then purified by column chromatography on silica gel using hexane as an eluent to obtain a colorless liquid (1.5 g, 83 %). $^1$H NMR (300 MHz, CDCl$_3$): $\delta$ (ppm) 7.34–7.42 (m, 3H), 6.92–6.98 (m, 3H), 3.84 (d, 2H), 1.68–1.82 (m, 1H), 1.22–1.48 (m, 8H), 0.82–0.98 (m, 6H), 0.22–0.42 (s, 9H). $^{13}$C NMR (300 MHz, CDCl$_3$): $\delta$ (ppm) 162.74, 161.32, 160.22, 159.48, 158.94, 133.03, 131.89, 129.82, 127.93, 125.32, 115.42, 112.43, 70.73, 38.94, 31.13, 28.95, 22.71, 14.15, 11.15, 0.00.

**4'-(2-Ethylhexyloxy)-3-ethynyl-2,4-difluorobiphenyl [BPA(F)].** (4'-(2-Ethylhexyloxy)-2,4-difluorobiphenyl-3-yl)ethynyl)trimethylsilane (1.4 g, 3.3 mmol) was dissolved in 30 mL of MC and a solution of 1.6 g of potassium hydroxide dissolved in 25 mL of methanol was added. The reaction mixture was stirred at room temperature for 2 h before quenching with water (100 mL) and extracted with MC (100 mL), dried over anhydrous Na$_2$SO$_4$ and the solvent was evaporated to afford the crude compound as yellow oil, which was then purified by column chromatography on silica gel using EA/hexane (3:1) as an eluent to obtain a colorless liquid (0.9 g, 78%). $^1$H NMR (300 MHz, CDCl$_3$): $\delta$ (ppm) 7.32–7.46 (m, 3H), 6.92–7.04 (m, 3H), 3.92 (d, 2H), 3.52 (s, 1H), 1.68–1.82 (m, 1H), 1.32–1.52 (m, 8H), 0.82–0.98 (m, 6H). $^{13}$C NMR (300 MHz,CDCl$_3$): $\delta$ (ppm) 162.74, 161.32, 160.22, 159.48, 158.94, 133.03, 131.89, 129.82, 127.93, 125.32, 115.42, 112.43, 86.42, 70.73, 38.94, 31.13, 28.95, 22.71, 14.15, 11.15.

**4,8-Bis(4'-(2-ethylhexyloxy)-3-ethynyl-2,4-difluorobiphenyl)benzo[1,2-b:4,5-b']dithiophene (7).** n-BuLi (2.5 M, 1.19 mL) was added dropwise to a solution of 4'-2-
ethylhexyloxy)-3-ethynyl-2,4-difluorobiphenyl (1.02 g, 2.9 mmol) in THF (25 mL) at 0 °C under N2 atmosphere. The temperature of the reaction mixture was raised to 50 °C and stirred for 1.5 h. 4,8-Dihydrobenzo[1,2-b:4,5-b']dithiophene-4,8-dione (0.3 g, 1.3 mmol) was added directly to the reaction mixture at 50 °C, which was then stirred for 2 h at the same temperature. Subsequently, the reaction mixture was cooled to room temperature and tin(II) chloride dihydrate (1.9 g, 19.75 mmol) in 15% HCl (20 mL) was added and further stirred for 1.5 h, before being poured into ice water. The reaction mixture was extracted with diethyl ether, the resultant organic layer was dried over anhydrous Na2SO4 and the solvent was evaporated to afford the crude compound as brown oil, which was then purified by column chromatography on silica gel using hexane as an eluent to obtain a yellow solid (0.48 g, 40 %). 1H NMR (300 MHz, CDCl3): δ (ppm) 7.76-7.80 (d, 2H), 7.60-7.66 (d, 2H), 7.38-7.52 (m, 6H), 6.98-7.08 (m, 6H), 3.92 (d, 4H), 1.72-1.78 (m, 2H), 1.28-1.52 (m, 16H), 0.82-0.98 (m, 12H). 13C NMR (300 MHz, CDCl3): δ (ppm) 163.10, 159.73, 159.60, 159.32, 157.57, 140.26, 138.41, 130.74, 130.02, 129.99, 128.73, 128.53, 126. 40, 125.30, 125.13, 125.12, 114.62, 111.73, 111.50, 111.17, 102.41, 95.34, 86.65, 70.50, 39.38, 30.52, 29.119, 23.86, 23.11, 14.16, 11.16.

2,6-(Trimethyltin)-4,8-bis(4'-ethylhexyloxy)-3-ethynyl-2,4-difluorobiphenylbenzo[1,2-b:4,5-b']dithiophene [BDTBPA(F)]: A solution of compound 4 (1 g, 1.1 mmol) in THF (30 mL) was placed in a 50 mL flask, which was flushed with N2 and the solution was cooled to -78 °C using dry ice/acetone. To the cooled solution, tert-BuLi (1.7 M, 1.3 mL) was added slowly and stirred for another 30 min at -78 °C and trimethyltin chloride (0.45 g, 2.2 mmol) was directly added as a solid. The solution was slowly warmed to room temperature and stirred overnight. Aqueous sodium carbonate (20 mL) was added slowly to the solution and extracted with MC (30 mL). The resultant organic layer was dried over anhydrous Na2SO4 and the solvent was
evaporated to afford a yellow residue, which was recrystallized from ethanol to obtain a yellow solid (0.9 g, 69%). $^1$H NMR (300 MHz, CDCl$_3$): $\delta$ (ppm) 7.86 (s, 2H), 7.76 (d, 2H), 7.54–7.66 (m, 8H), 7.44–7.50 (m, 2H), 6.98–7.04 (d, 4H), 3.92 (d, 4H), 1.72–1.78 (m, 2H), 1.28–1.52 (m, 16H), 0.82-0.98 (m, 12H), 0.39-0.58 (m, 18H). $^{13}$C NMR (300 MHz, CDCl$_3$): $\delta$ (ppm) 163.13, 159.86, 159.73, 159.48, 157.67, 140.47, 138.61, 130.92, 130.18, 130.03, 128.82, 128.56, 126.60, 125.39, 125.23, 125.18, 111.86, 111.62, 111.24, 95.24, 86.85, 70.58, 39.48, 30.72, 29.31, 23.76, 23.21, 14.18, 11.22, -8.18. Anal. Calcd for C$_{60}$H$_{66}$F$_4$O$_2$S$_2$Sn$_2$: C, 60.22; H, 5.56; F, 6.35; O, 2.67; S, 5.36; Sn, 19.84. Found: C, 60.12; H, 5.72.

**Polymerization for PBDTBPA(H)-DPP.** BDTBPA(H) (200 mg, 0.5 mmol) and DPP (121 mg, 0.5 mmol) were dissolved in CB (10 mL). The reaction mixture was flushed with argon for 15 min and Pd$_2$(dba)$_3$ (6 mg, 2 mole%), and (o-tolyl)$_3$P (14 mg, 16 mole%) was added and purged five times continuously with vacuum and argon. The reaction mixture was heated to 120 $^\circ$C for 6 h. After cooling to room temperature, the reaction mixture was poured into methanol to afford a precipitate, which was purified by Soxhlet extraction method using methanol, hexane and acetone, and then extracted in CF, which was evaporated to afford PBDTBPA(H)-DPP (58%). $^1$H NMR (300 MHz, CDCl$_3$): $\delta$ (ppm) 8.12–7.48 (m, 6H), 7.20–7.16 (m, 14H), 4.20–3.60 (m, 8H), 2.10–0.64 (64H); Anal. Calcd for C$_{84}$H$_{92}$N$_2$O$_4$S$_4$: C, 76.32; H, 7.01; O, 4.84; S, 9.70. Found: C, 76.56; H, 7.12; O, 4.98; S, 9.92.

**Polymerization for PBDTBPA(F)-DPP.** Microwave-assisted Stille polymerization reaction conditions were employed to synthesize PBDTBPA(F)-DPP. The procedure for the synthesis of polymer PBDTBPA(F)-DPP is as follows: To a 10 mL microwave tube, monomer PBDTBPA(F) (200 mg, 0.5 mmol), DPP (114 mg, 0.5 mmol), Pd$_2$(dba)$_3$ (8 mg, 2 mole%), and (o-tolyl)$_3$P (18 mg, 16 mole%) were dissolved in anhydrous CB (5 mL). The reaction mixture was purged with
N₂ for 15 min. The microwave tube was placed in the reactor and heated to 120 °C for 30 min. After cooling to room temperature, the reaction mixture was poured into methanol to afford a precipitate, which was purified by Soxhlet extraction method using methanol, hexane and acetone, and then extracted in CF, which was evaporated to get PBDTBPA(F)-DPP (47%). ¹H NMR (300 MHz, CDCl₃): δ (ppm) 8.12–7.48 (m, 6H), 7.20–7.16 (m, 10H), 4.20–3.60 (m, 8H), 2.10–0.64 (64H); Anal. Calcd for C₈₄H₈₈F₄N₂O₄S₄: C, 72.38; H, 6.36; O, 4.59; S, 9.20. Found: C, 72.18; H, 6.14; O, 4.72; S, 9.42.
