Experimental

General- All experiments were monitored by analytical thin layer chromatography (TLC). TLC was performed on pre-coated silica gel plates. After elution, plate was visualized under UV illumination at 254 nm for UV active materials. Melting points are uncorrected and were determined in capillary tubes on a melting point apparatus containing silicon oil. IR spectra were recorded using a Perkin-Elmer FTIR spectrophotometer. $^1$H NMR and $^{13}$C NMR spectra were recorded on Bruker 400 MHz spectrometer, using TMS as an internal standard (chemical shifts in $\delta$). The ESI-MS were recorded on Thermo Finnigan LCQ Advantage, Ion Trap Mass spectrometer. The HRMS spectra were recorded as a ESI-HRMS on Agilent 6520 Q-TOF, LC-MS/MS mass spectrometer. The reactions under microwave heating were carried out in Biotage initiator 2.5 microwave synthesizer using low absorption mode. The temperature in this instrument is determined by a calibrated external infrared sensor. All reagents and solvents were used as obtained commercially.

General procedure for the synthesis of 2-halophenylureas as exemplified for 1a$^1$

![Chemical structure of 1a]

To the flask containing aryl / alkyl isocyanate (5.0 mmol) in CH$_2$Cl$_2$ (5 mL), 2-bromoaniline (5 mmol) and triethylamine (1.5 equiv) were added under stirring at room temperature. The reaction was allowed to continue for 2h, after which the precipitated product separated from the reaction mixture was filtered, washed with hexane and dried under vaccum.

General procedure for the synthesis substituted 4H-benzo[d][1,3]oxazin-2-amines as exemplified for synthesis of 3aA

![Chemical structure of 3aA]

A 5 mL microwave vessel was charged with the 2-bromophenylurea 1a (0.1 g, 0.34 mmol), tert-butyl isocyanide 2A (0.06 mL, 0.52 mmol), Pd(OAc)$_2$ (0.038 g, 5 mol%), dpff (0.094 g, 5 mol%), Cs$_2$CO$_3$ (0.1 g, 0.34 mmol) and anhydrous toluene (2.0 mL). The vessel was degassed, refilled with nitrogen and sealed. The mixture was heated to 110 °C for 15 min under microwave irradiation. After cooling, the reaction mixture was filtered on a bed of Celite with EtOAc and the solvent removed under vacuum to obtain a residue which was
purified via silica gel column chromatography (hexanes/ EtOAc, 95:5, v/v) to furnish 3aA (0.09 g, 95 %) as a white solid.

General procedure for the synthesis of 2-(phenylamino)-4\(H\)-benzo[\(d\)][1,3]oxazin-4-one (10)\(^2\)
A mixture of (Z)-4-(tert-butylimino)-N-phenyl-4H-benzo[d][1,3]oxazin-2-amine 3aA (0.1 g, 0.34 mmol) and hydrochloric acid (1.0 M, 3 mL) in THF (10 mL) was heated at reflux for 3 h. Thereafter the mixture was diluted with water (20 mL) and extracted with EtOAc (2 X 35 mL). The organic layers were combined, dried over Na₂SO₄ and evaporated to obtain a residue which upon purification via silica gel column chromatography using hexane/ EtOAc (93:7, v/v) as an eluent furnished the 10 (0.07 g, 91%) as a white solid.

Typical procedure for the synthesis of 3-Cyclohexyl-2-(phenylamino)quinazolin-4(3H)-one (11)³

A solution of 3aB (0.1 mg, 0.31 mmol) in piperidine (3 mL) was stirred at room temperature for 1h. After completion of the reaction, the resulting mixture was evaporated under reduced pressure to obtain a residue which was dissolved in EtOAc (5 mL) followed by addition of silica gel (100-200 mesh, 75 mg). The mixture was stirred at room-temperature overnight and then silica gel was filtered off. The filtrate was evaporated under reduced pressure to afford a residue which was purified upon silica gel column chromatography using hexanes/ EtOAc (80:20, v/v) as the eluent to furnish 0.07 mg (67%) of 11 as a white solid.
