**General methods:** Unless otherwise noted, all solvents were purified according to the standard procedures. Dioxane, toluene, MeCN, DME and THF were distilled prior to use. 3-Phenylpropanal, propionaldehyde, benzaldehyde and furan-2-carbaldehyde were distilled prior to use. N-Tosylhydrazones 7a was prepared from 3-phenylpropanal according to the known procedure. Other reagents were reagent grade and were used without purification. The $^1$H-NMR spectra were recorded at 400, or 300 MHz (Bruker AV) in CDCl$_3$, CD$_3$OD, acetone-$_d_6$ or DMSO-$_d_6$. The $^{13}$C-NMR spectra were recorded at 150 or 100 MHz in CDCl$_3$, CD$_3$OD or DMSO-$_d_6$. Chemical shifts are given in ppm relative to TMS or the appropriate solvent peak. Coupling constants ($J$ values) are reported in Hertz (Hz). High resolution mass spectra (HRMS) were measured using an IonSpec Ultima 7.0 TFT-ICR-MS instrument (IonSpec, USA) with a Waters Z-spray source. Column chromatography was performed on silica gel 100-200 mesh or 200-300 mesh.

**General procedure for the synthesis of 9a from N-tosylhydrazones 7a and 1-methyl-1$H$-tetrazole-5-thiol 8a**

A mixture of 7a (0.8 mmol, 1.0 equiv), 8a (1.6 mmol, 2.0 equiv), and base (2.4 mmol, 3.0 equiv) in solvent (4.0 mL) was stirred at 110 °C for 2 h under Ar atmosphere. After the completion of the reaction as monitored by TLC, the reaction mixture was cooled to room temperature and diluted with CH$_2$Cl$_2$ (20 mL). The mixture was filtered through a celite pad to remove the insoluble materials, and the filtrate was concentrated under reduced pressure. The residue was purified by flash chromatography on silica gel using a mixed solvent of EtOAc and petroleum ether as eluent to afford product 9a.

**General synthesis of thioethers 9 from aldehydes 12 and 1$H$-tetrazole-5-thiol 8 through a one-pot procedure**

A mixture of aldehyde 12 (1.6 mmol, 2.0 equiv) and TsNHNH$_2$ (1.6 mmol, 2.0 equiv) in dioxane (5.0 mL) was stirred at rt for 0.5 h under argon atmosphere. Then, LiOH (3.2 mmol, 4.0 equiv), 8 (0.8 mmol, 1.0 equiv), LiI (0.8 mmol, 1.0 equiv), and dioxane (3.0 mL) were recharged in situ to the reaction vessel. The resulting mixture was then stirred vigorously at 110 °C for 4 h under Ar atmosphere. After the completion of the reaction as monitored by TLC, the mixture was cooled to room temperature and diluted with CH$_2$Cl$_2$ (20 mL). The mixture was filtered through a celite pad to remove the insoluble materials, and the filtrate was concentrated under reduced pressure. The residue was purified by flash chromatography on silica gel by a mixed solvent of EtOAc and petroleum ether as eluent to afford product 9.
