Experimental Section

Materials and Measurements

All starting materials and solvents were reagent grade, commercially available and used without further purification. Elemental analyses (C, H and N) were performed on a Perkin-Elmer 2400 CHN elemental analyzer. TG analyses were performed on a Perkin–Elmer Thermal Analysis Pyris Diamond heated from room temperature to 900 °C under a N\(_2\) atmosphere at a rate of 10 °C min\(^{-1}\).

**Synthesis of complex 1:** A solution of Cd(NO\(_3\))·4H\(_2\)O (0.105g), 2-H\(_2\)aip (0.054g), 2,2’-bipyridine (0.09 g) in DMF (5 mL) was heated at 130 °C for 3 days. The resulting brown crystals were collected, washed with ethanol, and dried at room temperature. Elemental analysis for C\(_{24}\)H\(_{27}\)CdN\(_3\)O\(_6\) (593.91) (%): calcd. C 48.54 H 4.58 N 11.79; found C 48.56 H 4.56 N 11.75.

**Luminescent measurements**

The PL properties of 1 in various solvent were investigated at room temperature. The strongest emission wavelengths were located at 426 nm when excited at 350 nm. The 1-solvent were prepared by introducing 3 mg of 1 powder into 5 mL of
acetonitrile, dichloromethane, acetic ether, DMF, isopropanol, acetone, 1, 3-propanediol, cyclohexane, tetrahydrofuran, methanol and ethanol. After sonication treatment 90 min, aging for 6 h, the fluorescence spectra were measured. For the experiment of sensing metal ions, the 1-M\(^{x+}\) emulsions were prepared by introducing 3 mg of 1 powder into 5 mL of M(NO\(_3\))\(_x\) (M = K\(^+\), Zn\(^{2+}\), Cd\(^{2+}\), Cu\(^{2+}\), Ni\(^{2+}\), Co\(^{2+}\) or Ag\(^+\)) DMF solution. After sonication treatment 90 min, aging for 1 h, the luminescent spectra were measured. The width of the excitation slit was 2.5 nm and the emission slit was 2.5 nm.

**Fig. S6** The UV–vis spectra of the 1-$M^{x+}$ in DMF emulsions ($M^{x+} = K^+, Ag^+, Cd^+, Co^{2+}, Ni^{2+}, Cu^{2+}$ and $Zn^{2+}$).
Fig. S7 Time-dependent photoluminescence intensities of 1-M$^{x+}$+Ni$^{2+}$ (a), 1-M$^{x+}$+Co$^{2+}$ (b), 1-M$^{x+}$+Ni$^{2+}$+Cu$^{2+}$ (c) and 1-M$^{x+}$+Co$^{2+}$+Cu$^{2+}$ (d) ($M^{x+}$ = K$^+$, Cd$^{2+}$ and Zn$^{2+}$).

In order to check the selectivity of 1 to Ni$^{2+}$ or Co$^{2+}$ ions upon other metal ions (K$^+$, Zn$^{2+}$ and Cd$^{2+}$), the experiments have been carried out under the same experimental conditions. When a solution (0.1 mL, containing $5 \times 10^{-5}$ mole Ni$^{2+}$/Co$^{2+}$ ions) is introduced into the solvent containing mixed metal ions, the time-depended emission spectra of two mixed solvent were measured (Fig. 7a and 7b). Ni$^{2+}$/Co$^{2+}$ ions show varying degrees of quenching. The luminescence intensities of 1-M$^{x+}$+Ni$^{2+}$ and 1-M$^{x+}$+Co$^{2+}$ are approximately a half and one third of that of 1-M$^{x+}$ ten seconds later. Then, the luminescence of both solvent exhibit nearly no change.

In order to evaluate the interference of Ni$^{2+}$/Co$^{2+}$ ions, new experiments are carried out. The sample is immersed in an DMF solution (5 mL) containing mixed metal ions ($5 \times 10^{-5}$ mole K$^+$, Zn$^{2+}$, Cd$^{2+}$ and Ni$^{2+}$/Co$^{2+}$ respectively). When a solution (0.1 mL, containing $5 \times 10^{-5}$ mole Cu$^{2+}$ ions) is introduced into the solvent containing mixed metal ions respectively, the solvent shows a dark colour ten seconds later under UV light, which is easy to distinguish the colour difference to the naked eye. The measurement of the emission spectrum shows the luminescence is quenched fast.
indicating the selectivity for Cu$^{2+}$ ions is not interfered by the existence of other metal ions. Summarily, the experimental results confirm that this material features such highly selective and fast sensing of Cu$^{2+}$ ions in dilute solution through fluorescence quenching upon mixed metal ions again.

**Fig. S8** Optical images of the samples (a) (left to right: 1-M$^{x+}$+Ni$^{2+}$ and 1-M$^{x+}$+Ni$^{2+}$+Cu$^{2+}$) and (b) (left to right: 1-M$^{x+}$+Co$^{2+}$ and 1-M$^{x+}$+Co$^{2+}$+Cu$^{2+}$) under the irradiation of UV light of 365 nm.
