[Chemical structures and reactions]

Electronic Supplementary Material (ESI) for RSC Advances. This journal is © The Royal Society of Chemistry 2015

Materials and Methods:

All reagents and starting materials were obtained commercially from Sigma-Aldrich and Alfa Aesar and Merck. The amines were purified and N-arylated derivatives are synthesised by reported procedures from their respective precursors. TLC chromatography was performed on silica (Silica Gel 60 F254) pre-coated aluminium plates and the products were visualized by UV lamp (PHILIPS TUV 8W lamp) and I2 stain. X-ray powder diffraction (XRD) patterns were recorded using a Cu Kα radiation source on a PAN Analytical, Holland, X’pert Pro powder diffractometer instrument. Transmission electron microscopy studies were performed using a PHILIPS CM200 Transmission Electron Microscope (TEM) at 100 kV. ICP-AES (Inductively Coupled Plasma-Atomic Emission Spectrometer) were performed using ARCOS model instrument from M/s Spectro, Germany. The 1H and 13C NMR was recorded in CDCl3 using residual solvent peak as a reference on a Avance III, Bruker spectrophotometer at 400 MHz and 100 MHz, respectively.

Catalytic studies

In a typical experiment, Tertiary amine (1mmol), Ethyl Cyanoformate (248 µL, 2.5 mmol) and methanol (2mL) were taken into 25ml single neck round bottomed flask back filled with nitrogen (a few drops of acetonitrile and hexane were in the case of tetrahydroisoquinoline derivatives to ensure the complete dissolution of starting materials]. Nano γ-Fe₂O₃ (16 mg, 10 mol %) and 70% aqueous tert-Butyl hydrogen peroxide (350 µL, 2.5 equivalents) were added successively after 2 minutes at room temperature. The reaction mixture was heated up to 65º C for the respective time and then allowed to cool to room temperature. The catalyst was recovered by an external laboratory magnet and the solvent was removed under vacuo. Water (5mL) was added to the residue followed by extraction with ethyl acetate (3 X 5 mL).The aqueous phase was discarded, the combined organic layers were dried over sodium sulfate and concentrated under reduced pressure and purified on a short pad of neutral silica gel (neutral silica gel made by basifying the acidic sites of silica with
triethyl amine) as stationary phase and pet ether/ethyl acetate = 90:10 as mobile phase, to give the desired product. The product identity was further confirmed by NMR.

*Neutral silica gel preparation:* Triethylamine (2-3 ml) was added to 150 gm 60-120 silica gel and made into slurry by addition of petroleum ether for the evenly distribution of the amine. The solvent was removed under reduced pressure on a rotary evaporator and dried in vacuum overnight.

**Modified general procedure for the synthesis of N-Aryl amines:** Copper (I) Iodide (10 mol%) and potassium phosphate (2 equiv) were taken into the round bottomed flask filled with nitrogen, 2-propanol and ethylene glycol (2 equiv) were added and allowed to stir for 5 min, secondary amine (1.3 equiv) and aryl iodides (1 equiv) were added successively at room temperature. The reaction mixture was heated up to reflux temp (oil bath temp=105°C) for 30 hours and then allowed to cool to room temperature. The solvent was removed under *vacuo*, water *ca* 10mL was added and extracted with dichloromethane/diethyl ether. The organic layer was dried over sodium sulfate. The solvent was concentrated under reduced pressure and purified by column chromatography on neutral silica gel (hexane/ethyl acetate = 95:5) to give the desired product.

*Neutral silica gel preparation:* Triethylamine (2-3 ml) was added to 150 gm 60-120 silica gel and made into slurry by addition of petroleum ether for the evenly distribution of the amine. The solvent was removed under reduced pressure on a rotary evaporator and dried in vacuum overnight.

**Procedure for N-arylation of pyrrolidines:** Copper (I) iodide (10 mol %) and potassium phosphate (2 equiv) were taken into the round bottomed flask backfilled with nitrogen. To this, 2-propanol and ethylene glycol (2 equiv) were added and allowed to stir for 5 min, pyrrolidine (3 equiv) and aryl iodides (1 equiv) were added successively at room temperature. The reaction mixture was heated up to 90°C (oil bath temp) for 24 hours and then allowed to cool to room temperature. Water 5 mL was added to the reaction mixture and the products were extracted with diethyl ether (3 X 5mL). The combined organic layers were dried over anhydrous sodium sulfate.
The solvent was concentrated under reduced pressure and purified by column chromatography on neutral silica gel (hexane/ethyl acetate = 95:5), to give the desired product.

Neutral silica gel preparation: Triethylamine (2-3 ml) was added to 150 gm 60-120 silica gel and made into slurry by addition of petroleum ether for the evenly distribution of the amine. The solvent was removed under reduced pressure on a rotary evaporator and dried in vacuum overnight.

Procedure for reduction of 2-(4-methoxyphenyl)-1,2,3,4-tetrahydroisoquinoline-1-carbonitrile

\[
\begin{align*}
\text{H}_2\text{N} & \\
\text{H}_2\text{N} & \\
\end{align*}
\]

A solution of 1a (1mmol) in dry ether (5ml) was added drop wise to a solution of LiAlH₄ (6mmol) in dry ether (8ml) at 0°C under N₂ atmosphere within 10-15 min (A few drops of dry THF was added for the complete dissolution of 1a). After the complete addition, the resulting suspension was allowed to come to room temperature and stirred for 5-6 hrs. The reaction mass was quenched by drop wise addition of water (ca. 6ml) at 0-5°C. The resulting reaction mass was filtered through celite bed and the bed was washed with ether (2 X 10 mL). Filtrate was collected and then extracted with ether (3 X 20mL). The combined organic layers were dried over anhydrous Na₂SO₄ and concentrated under reduced pressure. Purification by column chromatography on neutral silica gel* (95:4.5:0.5, CH₂Cl₂: MeOH: NH₃) afforded a brown color oil (63% yield).

Neutral silica gel preparation: Triethylamine (2-3 ml) was added to 150 gm 60-120 silica gel and made into slurry by addition of petroleum ether for the evenly distribution of the amine. The solvent was removed under reduced pressure on a rotary evaporator and dried in vacuum overnight.
2-((Methyl(phenyl)amino)acetonitrile\textsuperscript{1}

\begin{center}
\includegraphics[width=0.2\textwidth]{methylphenylaminoacetonitrile.png}
\end{center}

Known compound, Yellow oil, 80% yield (116.8mg, 1.0 mmol), $\delta_\text{H} (400\text{ MHz, CDCl}_3)$ 7.31 – 7.24 (m, 2H), 6.89 (tt, $J = 7.5, 1.0$ Hz, 1H), 6.84 – 6.79 (m, 2H), 4.05 (s, 2H), 2.91 (s, 3H); $\delta_\text{C} (101\text{ MHz, CDCl}_3)$ 147.8, 129.5, 120.1, 115.7, 114.8, 42.1, 39.2

2-(Methyl\textit{p}-tolyl)amino)acetonitrile\textsuperscript{1}

\begin{center}
